

# $B \rightarrow \mu^+ \mu^-$ and other very rare $B$ decays at LHCb

---

Matteo Rama

INFN Pisa

on behalf of the LHCb collaboration

BEAUTY 2019

Ljubljana, 30 September – 4 October 2019

# Introduction

- FCNC are forbidden in SM at tree level. Possible through loop diagrams:

- Suppressed
- Potential sizeable interference with transitions mediated by new particles

- $B \rightarrow l^+ l^-$  decays belong to this category

- Further helicity suppressed
- Theoretically clean SM predictions

➔ Powerful probes of physics beyond SM

- Lepton flavour violating transitions are experimentally forbidden in SM

- If mediated through neutrino mixing, predicted rates are  $< 10^{-50}$
- Significantly enhanced in many SM extensions, up to already testable rates

- In this talk:

- Status and prospects of measurements of  $B \rightarrow l^+ l^-$  and  $B$  LFV decays at LHCb.

- For discussions of other rare  $B$  decays at LHCb see:

- P. Krokovny, *Radiative decays at LHCb*, Tue 1 October
- F. J. Kress,  *$b \rightarrow sll$  and friends (studies with muons) at LHCb*, Wed 2 October
- C. Langenbruch,  *$b \rightarrow sll$  and friends ( $R_{K^{(*)}}$ , ...)* at LHCb, Wed 2 October
- M. J. Tilley, *Semileptonic  $B$  decays at LHCb*, Thu 3 October

# Selection of $B_{(s)}^0 \rightarrow \mu^+ \mu^-$ decays

PRL 118, 191801 (2017)

- FCNC processes strongly helicity-suppressed. Theoretically very clean.

$$BF(B_s^0 \rightarrow \mu^+ \mu^-) = (3.57 \pm 0.17) \times 10^{-9}$$

$$BF(B^0 \rightarrow \mu^+ \mu^-) = (1.06 \pm 0.09) \times 10^{-10}$$

PRL 112 (2014) 101801  
EPJC 77 (2017) 112

- Dataset: Run 1 + 1.4 fb<sup>-1</sup> of Run 2 (tot: 4.4 fb<sup>-1</sup>)
- Basic selection requirement:
  - two oppositely-charged muon tracks with common vertex displaced from primary vertex
  - $m_{\mu\mu}$  mass peaking at the  $B_{(s)}^0$  mass
- In practice, complex analysis due to low signal/large background rates
- Most abundant background is combinatorial
  - muons from different  $b$  quark decays
  - strongly suppressed with multivariate operator (BDT) using track isolation, topo/geom information

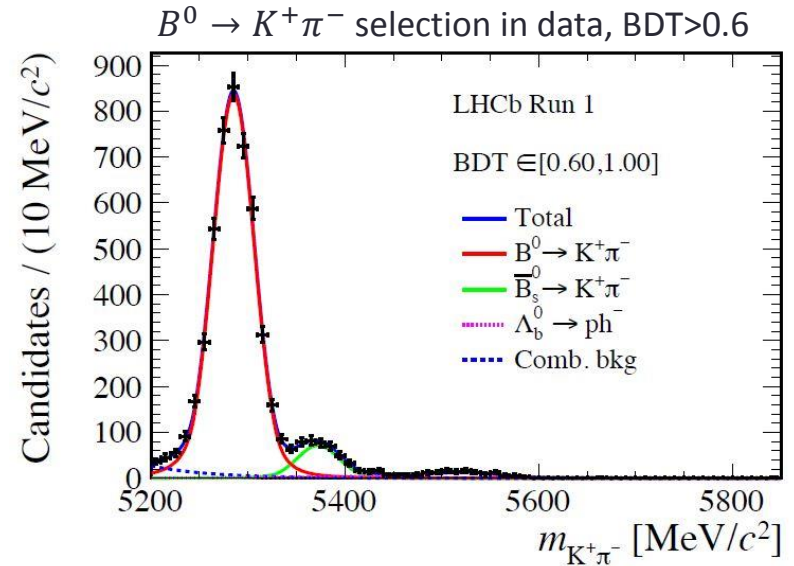

Typical combinatorial background event with two muons from different  $b$  decays

# BDT calibration

PRL 118, 191801 (2017)

- BDT output flat for  $B^0$  signal and peaking at zero for combinatorial background
- $B^0 \rightarrow \mu\mu$  BDT shape from  $B^0 \rightarrow K^+\pi^-$  in data and corrected for trigger and PID selection. Additional lifetime-related correction for  $B_s^0 \rightarrow \mu\mu$

# Physics backgrounds

PRL 118, 191801 (2017)

Yields of main *physics* backgrounds *in signal region* with BDT>0.5:

$B \rightarrow h^+ h'^-$	$2.9 \pm 0.3$
$B_c^+ \rightarrow J/\psi \mu^+ \nu_\mu$	$1.2 \pm 0.2$
$B_{(s)}^0 \rightarrow h^- \mu^+ \nu_\mu$	$0.80 \pm 0.06$
$\Lambda_b^0 \rightarrow p \mu^- \bar{\nu}_\mu$	$0.7 \pm 0.2$
$B^{0(+)} \rightarrow \pi^{0(+)} \mu^+ \mu^-$	negligible

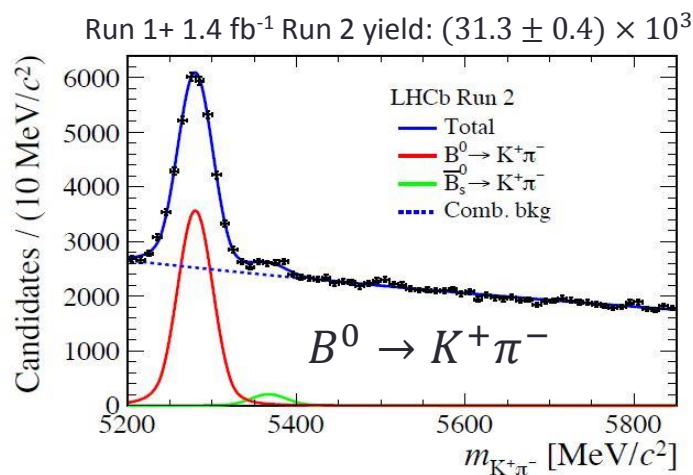

- These decays are taken into account in the fit to  $m_{\mu\mu}$ . Mass shapes and yield vs BDT determined from simulated samples with misID probability calibrated on data
- $B \rightarrow h^+ h'^-$  particularly dangerous because peaks in the  $B^0$  signal region
  - Alternative estimates of  $B \rightarrow h^+ h'^-$  and  $B_{(s)}^0 \rightarrow h^- \mu^+ \nu_\mu$  yields from  $h\mu$  mass spectra in data
- SM ISR  $B_s^0 \rightarrow \mu^+ \mu^- \gamma$  has negligible impact on signal yield from fit
- -60% combinatorial background reduction wrt previous analysis by optimizing BDT+PID

# Normalisation

PRL 118, 191801 (2017)

$$BF(B_{(s)}^0 \rightarrow \mu\mu) = \underbrace{\frac{BF_{norm}}{N_{norm}}}_{\text{norm. channels}} \times \underbrace{\frac{\epsilon_{norm}^{Acc}}{\epsilon_{sig}^{Acc}} \times \frac{\epsilon_{norm}^{RecSel|Acc}}{\epsilon_{sig}^{RecSel|Acc}} \times \frac{\epsilon_{norm}^{Trig|RecSel}}{\epsilon_{sig}^{Trig|RecSel}}}_{\text{MC + input from data}} \underbrace{\frac{f_d}{f_{d(s)}}}_{\text{LHCb}} \underbrace{N_{B_{(s)}^0 \rightarrow \mu\mu}}_{\text{fit of } m_{\mu\mu}} = \alpha_{(s)} \times N_{B_{(s)}^0 \rightarrow \mu\mu}$$

- $\alpha_s = (5.7 \pm 0.4) \times 10^{-11}$ ;  
 $\alpha = (1.60 \pm 0.04) \times 10^{-11}$       Weighted averages from  $B^+ \rightarrow J/\psi K^+$  and  $B^0 \rightarrow K^+ \pi^-$
- $f_s/f_d = 0.259 \pm 0.015$  measured by LHCb at 7 TeV
- Procedure checked by measuring  $BF(B^0 \rightarrow K\pi)/BF(B^+ \rightarrow J/\psi K^+)$  and  $BF(B_s \rightarrow J/\psi \phi)/BF(B^+ \rightarrow J/\psi K^+)$

# Results

PRL 118, 191801 (2017)

- BFs measured from UML fit of  $m_{\mu\mu}$  simultaneously in 5 bins of BDT:

$$BF(B_s^0 \rightarrow \mu^+ \mu^-) = (3.0 \pm 0.6_{-0.2}^{+0.3}) \times 10^{-9}$$

**7.8  $\sigma$**

First observation from single experiment

$$BF(B^0 \rightarrow \mu^+ \mu^-) = (1.5_{-1.0}^{+1.2} \pm 0.1) \times 10^{-10}$$

1.6  $\sigma$

$$< 3.4 \times 10^{-10} \text{ at 95\% CL}$$

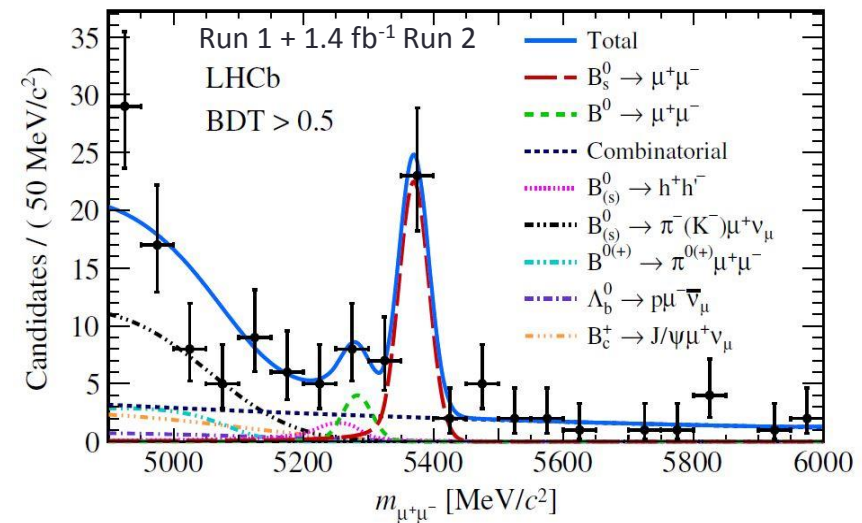

- Results consistent with SM

NB:  $BF(B_s^0 \rightarrow \mu\mu)$  assumes  $\tau_{B_s^0 \rightarrow \mu\mu} = \tau_{B_s}/(1 - y_s)$  (i.e.  $A_{\Delta\Gamma} = 1$ )

It increases by 4.6% (10.9%) if  $A_{\Delta\Gamma} = 0$  ( $-1$ ) (the sel efficiency decreases)

- Main sources of systematic uncertainty:

- $BF(B_s^0 \rightarrow \mu^+ \mu^-)$ : knowledge of  $f_s/f_d$
- $BF(B^0 \rightarrow \mu^+ \mu^-)$ :  $B \rightarrow hh$  backgrounds

# $B_s^0 \rightarrow \mu^+ \mu^-$ effective lifetime

PRL 118, 191801 (2017)

- The effective lifetime is an additional probe for NP complementary to the BF

$$\tau_{\mu^+ \mu^-} \equiv \frac{\int_0^\infty t \Gamma(B_s(t) \rightarrow \mu^+ \mu^-) dt}{\int_0^\infty \Gamma(B_s(t) \rightarrow \mu^+ \mu^-) dt}$$

- In terms of the physics parameters:

$$\tau_{\mu^+ \mu^-} = \frac{\tau_{B_s^0}}{1 - y_s^2} \left( \frac{1 + 2A_{\Delta\Gamma}^{\mu^+ \mu^-} y_s + y_s^2}{1 + A_{\Delta\Gamma}^{\mu^+ \mu^-} y_s} \right)$$

$$\tau_{B_s^0} = 1.510 \pm 0.004 \text{ ps}$$

$$y_s \equiv \tau_{B_s} \Delta\Gamma/2 = 0.062 \pm 0.006$$

$$A_{\Delta\Gamma}^{\mu^+ \mu^-} = 1 \text{ in SM, can be in } [-1, 1) \text{ if NP occurs}$$

- Measured from fit to the  $B_s^0 \rightarrow \mu^+ \mu^-$  decay time ( $\int L dt = 4.4 \text{ fb}^{-1}$ )

$$\tau(B_s^0 \rightarrow \mu^+ \mu^-) = 2.04 \pm 0.44 \pm 0.05 \text{ ps}$$

First measurement of this quantity

At present, consistent with any value of  $A_{\Delta\Gamma}^{\mu^+ \mu^-}$

# Search for $B_{(s)}^0 \rightarrow \tau^+ \tau^-$ decays

PRL 118 (2017) 251802

- In SM FCNC processes analogous to  $B_{(s)}^0 \rightarrow \mu^+ \mu^-$  but less helicity-suppressed

$$BF(B_s^0 \rightarrow \tau^+ \tau^-) = (7.73 \pm 0.49) \times 10^{-7}$$

$$BF(B^0 \rightarrow \tau^+ \tau^-) = (2.22 \pm 0.19) \times 10^{-8} \quad \text{PRL 112 (2014) 101801}$$

$$\frac{\mathcal{B}(B_{(s)}^0 \rightarrow \tau^+ \tau^-)}{\mathcal{B}(B_{(s)}^0 \rightarrow \mu^+ \mu^-)} = \frac{m_\tau^2}{m_\mu^2} \times \sqrt{\frac{m_B^2 - 4m_\tau^2}{m_B^2 - 4m_\mu^2}} \sim \mathbf{210}$$

- NP models explaining observed SM tensions in  $b \rightarrow sl^+ l^-$  and  $b \rightarrow cl^- \bar{\nu}_l$  transitions allow possible increase of  $BF$  by orders of magnitude
- $\tau^+ \rightarrow \pi^+ \pi^- \pi^+ \bar{\nu}_\tau$  .  $\tau$  decay model tuned on BaBar data
- Approximate reconstruction of  $B \rightarrow \tau^+ \tau^-$  using geo and mass constraints
- NN built with geometric, kinematic and isolation variables to separate signal and background
- Run 1 dataset (3 fb<sup>-1</sup>)
- Signal extracted from fit to NN in signal region
  - Yield  $\rightarrow$  BF using  $B^0 \rightarrow D^+ [K^- \pi^+ \pi^+] D_s^- [K^+ K^- \pi^-]$

$$BF(B_s^0 \rightarrow \tau^+ \tau^-) < 6.8 \times 10^{-3} \text{ @ 95\% CL} \quad \text{first limit}$$

$$BF(B^0 \rightarrow \tau^+ \tau^-) < 2.1 \times 10^{-3} \text{ @ 95\% CL} \quad \text{x 2.6 improvement wrt BaBar limit}$$

# Prospects for $B \rightarrow l^+ l^-$ at LHCb

	now	$\int L dt = 23 \text{ fb}^{-1}$	$\int L dt = 300 \text{ fb}^{-1}$
err $BF(B_s^0 \rightarrow \mu^\pm \mu^\mp)$	$0.65 \times 10^{-9}$	$0.30 \times 10^{-9}$ [1]	$0.13 \times 10^{-9}$ [1]
rel err $BF_{B^0 \rightarrow \mu\mu} / BF_{B_s^0 \rightarrow \mu\mu}$	90%	34% [1]	10% [1]
rel err $\tau_{B_s^0 \rightarrow \mu\mu}$	21%	8% [1]	2% [1]
err $S_{B_s^0 \rightarrow \mu\mu}$	—	—	0.2 [1]
UL $BF(B_s^0 \rightarrow \tau^+ \tau^-)$	$6.8 \times 10^{-3}$	$1.9 \times 10^{-3}$ [2]	$5 \times 10^{-4}$ [1]

LHCb  $B_{(s)}^0 \rightarrow e^+ e^-$  measurement in progress

[1] CERN-LHCb-PUB-2018-009

[2] From current limit assuming  $1/\sqrt{\int L dt}$  scaling

# Lepton flavour violating $B$ decays

- The only lepton flavour violating (LFV) phenomenon observed so far is neutrino oscillation. If this was the only LFV mechanism, LFV  $B$  decay rates would be  $< 10^{-50}$ : far beyond current and future experimental reach.
- Many models proposed to explain the tensions with SM in  $b \rightarrow sl^+l^-$  and  $b \rightarrow cl^-\bar{\nu}_l$  transitions ( $R_{K^{(*)}}$ ,  $R_{D^{(*)}}$ , etc) naturally allow sizeable LFV  $B$  rates, e.g. models with  $Z'$ , with scalar or vector LQ, or PS<sup>3</sup>.

for instance:

Becirevic, Kosnik, Sumensari, Zukanovich Funchal, JHEP 11 (2016) 035

Crivellin, Hofer, Matias, Nierste, Pokorski, Rosiek, PRD92 (2015) 054013

Hiller, Loose, Schonwald, JHEP 12 (2016) 027

Bordone, Cornella, Fuentes-Martin, Isidori JHEP 1810 (2018) 148

➔ it is interesting to search for LFV  $B$  decays

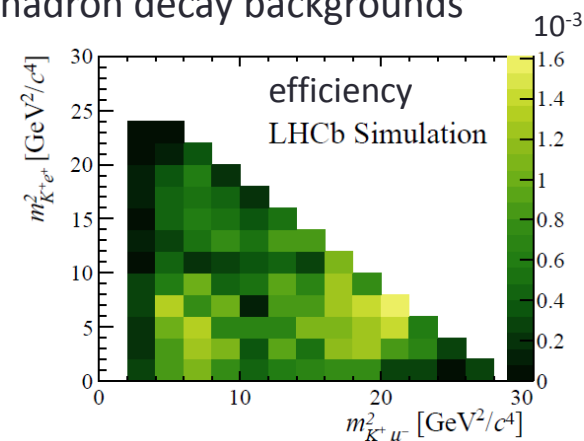

# Search for $B^+ \rightarrow K^+ \mu^\pm e^\mp$

arXiv:1909.01010

- Best limits before this measurement by BaBar
  - $BF(B^+ \rightarrow K^+ \mu^- e^+) < 9.1 \times 10^{-8}$  @ 90% CL
  - $BF(B^+ \rightarrow K^+ \mu^+ e^-) < 13 \times 10^{-8}$  @ 90% CL
- Branching fractions in the range  $10^{-8} - 10^{-10}$  in models with  $Z'$  or leptoquarks.
- Run 1 dataset ( $3 \text{ fb}^{-1}$ )
- $B^+ \rightarrow J/\psi(\rightarrow \mu^+ \mu^-) K^+$  and  $B^+ \rightarrow J/\psi(\rightarrow e^+ e^-) K^+$  used as control channels
- Background rejection:
  - $B^+ \rightarrow \overline{D}^0 X l^+ \nu_l$ ,  $\overline{D}^0 \rightarrow K^+ Y l'^- \bar{\nu}_{l'}$  and decays with charmonia rejected with mass vetoes
  - Two multivariate classifiers used to suppress combinatorial and  $b$ -hadron decay backgrounds
  - Resulting background yield from  $b$  decays is negligible
- Phase-space model assumed for signal

BF results can be corrected for different assumptions using efficiency maps given in the paper

# Search for $B^+ \rightarrow K^+ \mu^\pm e^\mp$

arXiv:1909.01010

- Signal yields converted to BF using  $B^+ \rightarrow J/\psi(\rightarrow \mu^+ \mu^-) K^+$  norm. channel
- No signal found  $\rightarrow$  set BF upper limits

$$BF(B^+ \rightarrow K^+ \mu^- e^+) < 9.5 \times 10^{-9} @ 95\% CL$$

$$BF(B^+ \rightarrow K^+ \mu^+ e^-) < 8.8 \times 10^{-9} @ 95\% CL$$

$> 10 \times$  improvement w.r.t. previous limits from BaBar

# Search for $B_{(s)}^0 \rightarrow \tau^\pm \mu^\mp$

arXiv:1905.06614

- Exp status before this measurement
  - $BF(B^0 \rightarrow \tau^\pm \mu^\mp) < 2.2 \times 10^{-5}$  @ 95% CL BaBar
  - no limit on  $BF(B_s^0 \rightarrow \tau^\pm \mu^\mp)$
- Branching fractions up to  $10^{-5}$  in models with  $Z'$  or leptoquarks.  
see e.g. JHEP07 (2019) 168
- Run 1 dataset (3 fb<sup>-1</sup>)
- $\tau^- \rightarrow \pi^- \pi^+ \pi^- \nu_\tau$  final state
  - Events from  $\tau^- \rightarrow \pi^- \pi^+ \pi^- \pi^0 \nu_\tau$  also included as signal
- $B$  mass reconstructed with 2-fold ambiguity
  - Missing momentum reconstructed through kinematic and vertex constraints
  - Solution with highest S/B is kept
- Background rejection:
  - Isolation variables to suppress decays with additional reconstructed particles
  - Multivariate classifier to suppress combinatorial background
  - $D^- \rightarrow \pi^- \pi^+ \pi^-$  vetoed with  $m(3\pi) < 1.8 \text{ GeV}/c^2$
  - $B_{(s)}^0 \rightarrow D_{(s)}^-(\rightarrow \mu^- \nu_\mu) \pi^+ \pi^- \pi^+$  suppressed based on decay time of  $3\pi$

# Search for $B_{(s)}^0 \rightarrow \tau^\pm \mu^\mp$

arXiv:1905.06614

- Selected candidates split into 4 samples according to the output of a BDT
- Signal yield in each sample extracted through fit to the  $B$  mass
  - two fits, fixing to 0  $N_{B^0}^{sig}$  or  $N_{B_s^0}^{sig}$
  - signal yields consistent with 0
- Signal yield converted to BF using  $B^0 \rightarrow D^-(\rightarrow K^+\pi^-\pi^-)\pi^+$  normalisation channel

$$BF(B_s^0 \rightarrow \tau^\pm \mu^\mp) < 4.2 \times 10^{-5} @ 95\% CL$$

$$BF(B^0 \rightarrow \tau^\pm \mu^\mp) < 1.4 \times 10^{-5} @ 95\% CL$$

first UL for  $B_s^0$ ,  $\sim 2 \times$  improvement w.r.t. BaBar for  $B^0$

# Search for $B_{(s)}^0 \rightarrow e^\pm \mu^\mp$

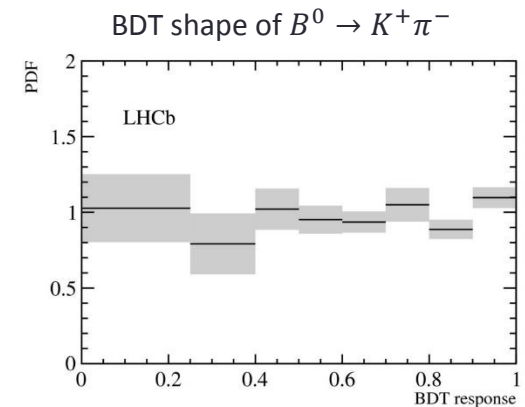

JHEP 1803 (2018) 078

- Decay allowed in several NP scenarios including e.g. models with  $Z'$  boson, heavy singlet Dirac neutrinos, SUSY and the Pati-Salam model
- Previous best limits by LHCb based on  $1 \text{ fb}^{-1}$  Run1 data
- Updated with full Run 1 dataset ( $3 \text{ fb}^{-1}$ )
- Selection and analysis strategy similar to  $B \rightarrow \mu\mu$ 
  - $B^0 \rightarrow K^+\pi^-$  and  $B^+ \rightarrow J/\psi K^+$  used as normalisation channels
  - $B^0 \rightarrow K^+\pi^-$  also used to calibrate the signal BDT shape
- Main background from  $b\bar{b} \rightarrow e^\pm \mu^\mp X$  decays
- Events in signal region consistent with the expected background:

$$BF(B_s^0 \rightarrow e^\pm \mu^\mp) < 6.3 \times 10^{-9} \text{ @ 95\% CL}$$

$$BF(B^0 \rightarrow e^\pm \mu^\mp) < 1.3 \times 10^{-9} \text{ @ 95\% CL}$$

Best UL to date, improved by factor 2-3 since previous LHCb measurement

# Prospects for LFV decays at LHCb

	UL @ $50 \text{ fb}^{-1}$	UL @ $300 \text{ fb}^{-1}$

[2] From current limit assuming  $1/\sqrt{\int Ldt}$  scaling.

[3] From current limit assuming  $1/\int Ldt$  scaling (a little optimistic).

[4] From [1] assuming  $1/\sqrt{\int Ldt}$  scaling.

[5] From JHEP 02 (2015) 121 assuming  $1/\sqrt{\int Ldt}$  scaling.

More searches ongoing:  $B^0 \rightarrow K^{*0} e^\pm \mu^\mp$ ,  $\Lambda_b \rightarrow \Lambda e^\pm \mu^\mp$ , ...

NB: ULs @95%, except for  $\tau \rightarrow 3\mu$  @90%

# Summary

- Intense effort in LHCb to search for non-SM effects in rare and forbidden decays, including  $B \rightarrow l^+ l^-$  and LFV  $B$  decays
  - First single-experiment observation of  $B_s^0 \rightarrow \mu^+ \mu^-$  and first lifetime measurement, no evidence of  $B^0 \rightarrow \mu^+ \mu^-$  yet
  - Best upper limits on a number of rare or LFV decays, including  $B_{(s)}^0 \rightarrow \tau\tau$ ,  $B \rightarrow \tau\mu$ ,  $B \rightarrow e\mu$ ,  $B \rightarrow Ke\mu$
- Results consistent with SM. But...
  - ... all measurements presented today will be updated on full Run 2 dataset (6 fb<sup>-1</sup>, 13 TeV  $\rightarrow$   $> 3 \times B$  sample of Run 1)
  - Ongoing work on additional channels
- The imminent upgrade-I phase will allow a significant jump in sensitivity in the search for physics signals beyond the SM
