Literature and OF Tools

EuroCC workshop

Aleksander GRM

Literature

There are two main web pages with links to literature:

- ▶ openfoam.org (on PC workstations)
- ► cfd.direct (on HPC systems)

User guides:

- ▶ User Guide #1
- ► User Guide #2
- ► Programming Guide Learn c++ code!

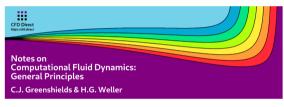

My GitHub repository:

► OpenFOAM_School@github

Link to my GoogleDrive location with books for OpenFOAM

About the Book

Notes on Computational Fluid Dynamics (CFD) was written for poole who use CFD in their work, research or study, providing essential knowledge to perform CFD analysis with providing essential knowledge to perform CFD analysis with confidence. In offers a modern perspective on CFD with the finite volume method, as implemented in OpenFOAM and the repondar general-purpose CFD software. Fulls did dynamics, turbulence modelling and boundary conditions are presented alongside the numerical methods and algorithms in a series of short, digastible topics, or notes, that contain omplete, consider and relevant information. The book benefits from the experience of the authors: Henry Weller, core developer of OpenFOAM such writing them I lies in 1989, and Chris Greenhields, who has delivered over 650 days of CFD training with OpenFOAM. Contents Preface

Symbols

- 1 Introduction
- 2 Fluid Dynamics 3 Numerical Method
- 4 Boundary Conditions
- 5 Algorithms and Solvers
- 6 Introduction to Turbulence
- 7 Reynolds-Averaged Turbulence Modelling
- 8 Sample Problems

ISBN 978-1-3999-2078-0, 291 pages.

GMSH Tools

Set GMSH environment

To use Python environment we need only to load it

To be able to run advanced GMSH examples we need to set up Python environment

```
1. load module python:
   $> ml av python (check target version)
   $> ml python-version
4
 2. Create new env:
   $> pvthon3 -m venv local
 3. Activate new env:
   $> source local/bin/activate
 4. Install new packages (active env local):
   $(local)> pip install numpy scipy sympy matplotlib gmsh
```

OpenFOAM Tools

To use OpenFOAM environment we need to load

```
List available modules:

y module avail openfoam

s ml av openfoam (equvalent with upper command)

For OpenFOAM to be running on HPC@ULFS we need to load this modules:

ml OpenFOAM/10-foss-2022a

source $FOAM_BASH (set new OpenFOAM environment variables)
```

Additional modules for OpenFOAM environment

```
Load additional modules to support gnuplot in OpenFOAM:

$ > ml OpenFOAM/10-foss-2022a

$ > source $FOAM_BASH

$ > ml av gnuplot (for foamMonitor application)

$ > ml spider gnuplot-version (see needed additional modules to load)

and load your Python evn with

$ > source work/Python/local/bin/activate (or path where your local Python is)
```

Add the following part at the end in system/controlDict

Create residual dictionary file system/residuals and include

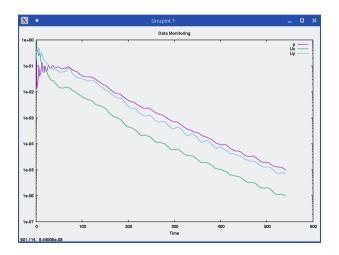

```
#includeEtc "caseDicts/postProcessing/numerical/solverInfo.cfg"

fields (p U);
```

Run monitor command

```
1 foamMonitor -l -r 1 postProcessing/residuals/0/solverInfo.dat
```

foamMonitor -l -r 1 postProcessing/residuals/0/solverInfo.dat

Parallel run OpenFOAM @ HPC

Parallel run is executed via **srun** command. All commands are packed in shell script and run with command

\$> sbatch parallel_run.sh

To check your queue use command

> squeue or only for user jobs > squeue --me

Links to Slurm help:

- ► Slurm help
- ► Slurm help @ FS-HPC

Check HPC constellation

\$> sinfo

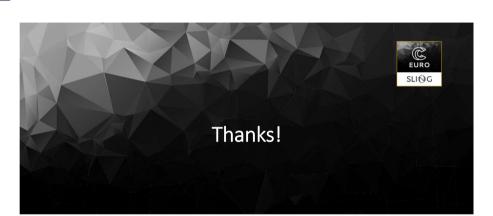

Bash script containing all commands to run OpenFOAM at HPC

```
#!/bin/bash
2 #SBATCH --export=ALL,LD PRELOAD=
  #SBATCH --partition=haswell
  #SBATCH --mem=0
  #SBATCH --ntasks 32
  #SBATCH --ntasks-per-node=16
  module purge
  module load OpenFOAM/10-foss-2022a
  source $FOAM BASH
11
  # Source tutorial run functions
13 source $FOAM ETC/../bin/tools/RunFunctions
```

```
14 # Path to running case
15 caseName="cavityFine"
  cd $caseName
  # decompose the case (number of decompositions is equal to --ntasks)
  runApplication decomposePar
20
  # run parallel
  echo "Start $(getApplication) in parallel. Log is written in case/log.$(
      getApplication)!"
  srun --mpi=pmix $(getApplication) -parallel
24
  # Check the running process with: tail -f case/log.$(getApplication)
```

This project has received funding from the European High-Performance Computing Joint Undertaking (JU) under grant agreement No 951732. The JU receives support from the European Union's Horizon 2020 research and innovation programme and Germany, Bulgaria, Austria, Coztais, Cypura, Cetch Republic, Demanria, Estonia, Flainind, Gerece, Hungary, Ireland, Italy, Lithuania, Latvia, Poland, Portugal, Romania, Stownia, Spain, Sweden, United Kingdom, France, Netherlands, Relation Literatures Skooksia Norwes, Suiteratura Triver, Republic of North American Leviand Montemperor.
