Thin wall  
and beyond

# Thin Wall

Ivanov, Matteini, MN, Ubaldi '22

$$V = \frac{\lambda}{8} (\phi^2 - v^2)^2 + \lambda \Delta v^3 (\phi - v)$$

Overall coupling

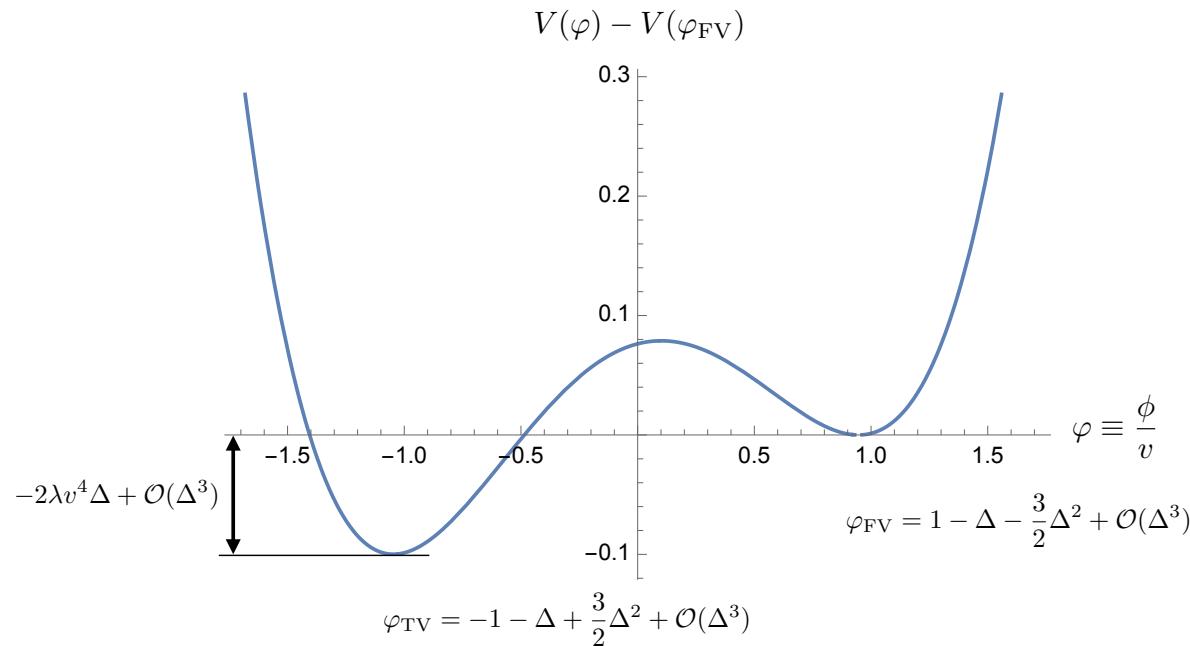

$$[\lambda] = 4 - D$$

Scale of the model

$$[v] = D/2 - 1$$

TW parameter

$$[\Delta] = 0$$

Perturbative

$$0 < \lambda \ll 1, \quad 0 < \Delta \ll 1, \quad \Delta_{\text{max}} = 3^{-3/2}$$

TW = near  
degenerate

$$V = \frac{\lambda}{8} (\phi^2 - v^2)^2 + \lambda \Delta v^3 (\phi - v)$$

Ivanov, Matteini, MN, Ubaldi '22

Expand the field around the bounce radius

$$\varphi(z) = \sum \varphi_n(z) \Delta^n, \quad z = \sqrt{\lambda}v \rho - r, \quad r = \frac{1}{\Delta} \sum r_n \Delta^n$$

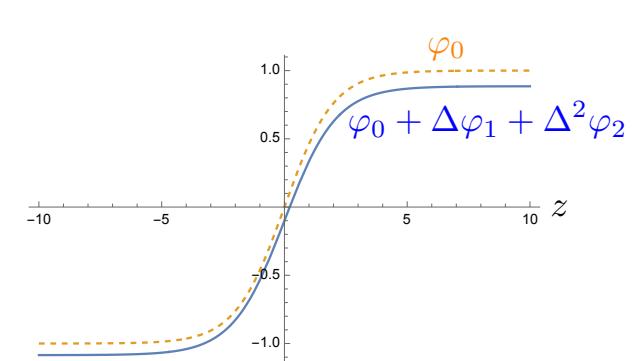

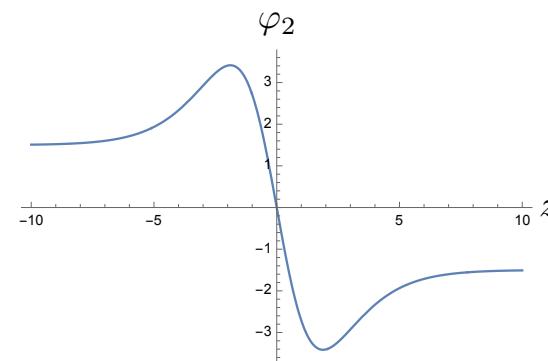

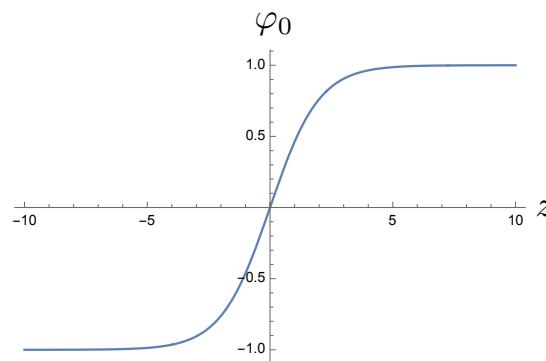

We solve the bounce equation

$$\varphi_0 = \operatorname{th} \frac{z}{2},$$

$$r_0 = \frac{D-1}{3},$$

$$\varphi_1 = -1,$$

$$r_1 = 0$$

See the paper for  $\varphi_2, \varphi_3$ , physical bubble profile

$$r_2 = \frac{6\pi^2 - 40 + D(26 - 4D - 3\pi^2)}{3(D-1)}$$

# Thin Wall Action

Ivanov, Matteini, MN, Ubaldi '22

$\lambda$  and  $v$  factor out

$$S = \frac{\Omega v^{4-D}}{\lambda^{D/2-1} \Delta^{D-1}} \times \tilde{S}[\Delta^2]$$

Leading order

$$S_0 = \frac{\Omega v^{4-D}}{\lambda^{D/2-1} \Delta^{D-1}} \left( \frac{D-1}{3} \right)^{D-1} \frac{2}{3D}$$

Matteini, MN,  
Shoji, Ubaldi '23

Now also done + more

Higher orders

$$S_2 = S_0 \left( 1 + \Delta^2 \left( \frac{1 + D (25 - 8D - 3\pi^2)}{2(D-1)} \right) + \mathcal{O}(\Delta^4) \right)$$

New & relevant

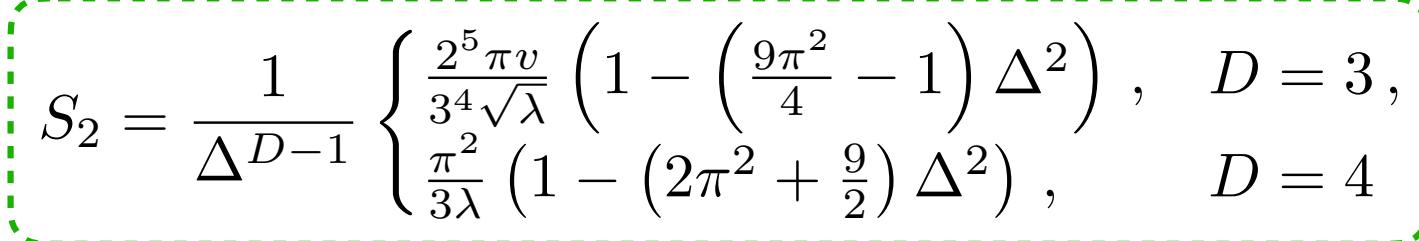

Perturbativity

$D = 4$  : FV decay at  $T = 0$

Coleman '77

$D = 3$  : FV nucleation at finite  $T$

Affleck '81, Linde '83

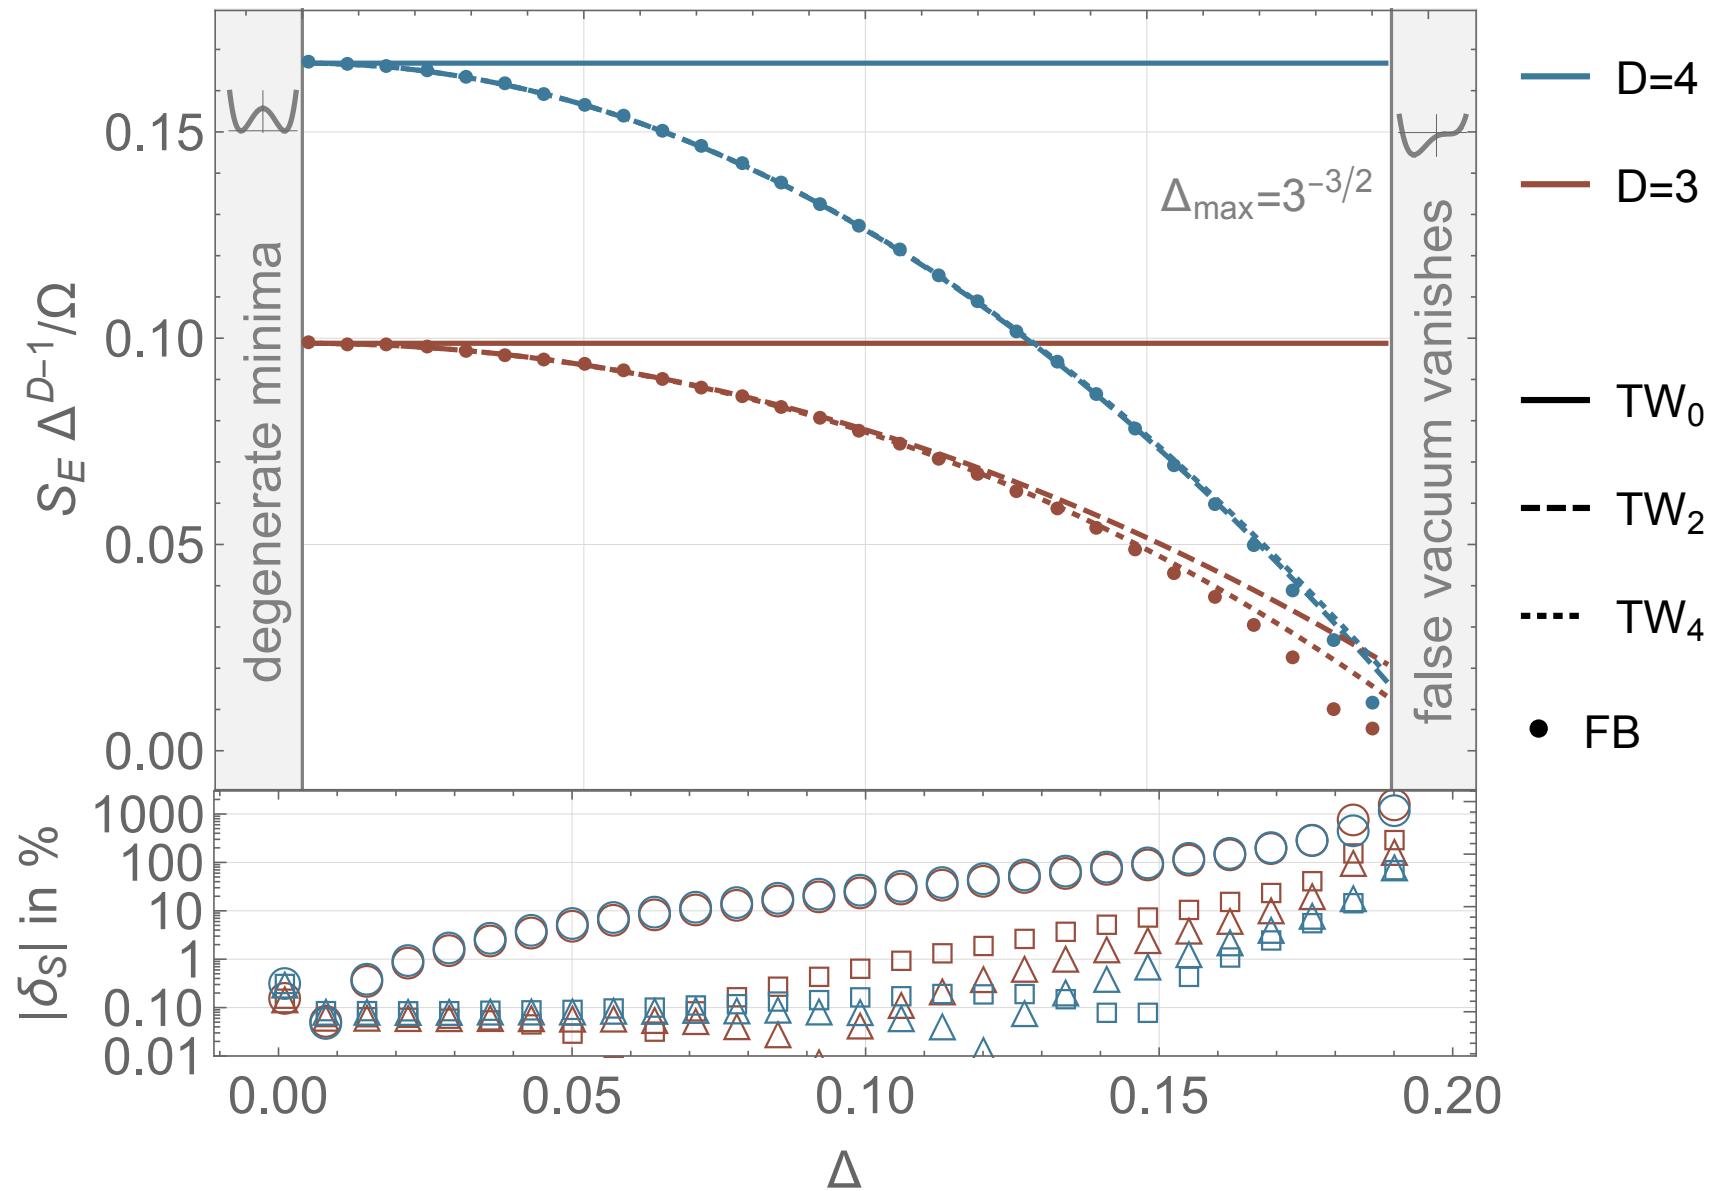

$$S_2 = \frac{1}{\Delta^{D-1}} \begin{cases} \frac{2^5 \pi v}{3^4 \sqrt{\lambda}} \left( 1 - \left( \frac{9\pi^2}{4} - 1 \right) \Delta^2 \right), & D = 3, \\ \frac{\pi^2}{3\lambda} \left( 1 - \left( 2\pi^2 + \frac{9}{2} \right) \Delta^2 \right), & D = 4 \end{cases}$$

# Thin Wall Action

Ivanov, Matteini, MN, Ubaldi '22

How good/useful is TW? Pretty good all the way to  $\Delta_{\max}$ !

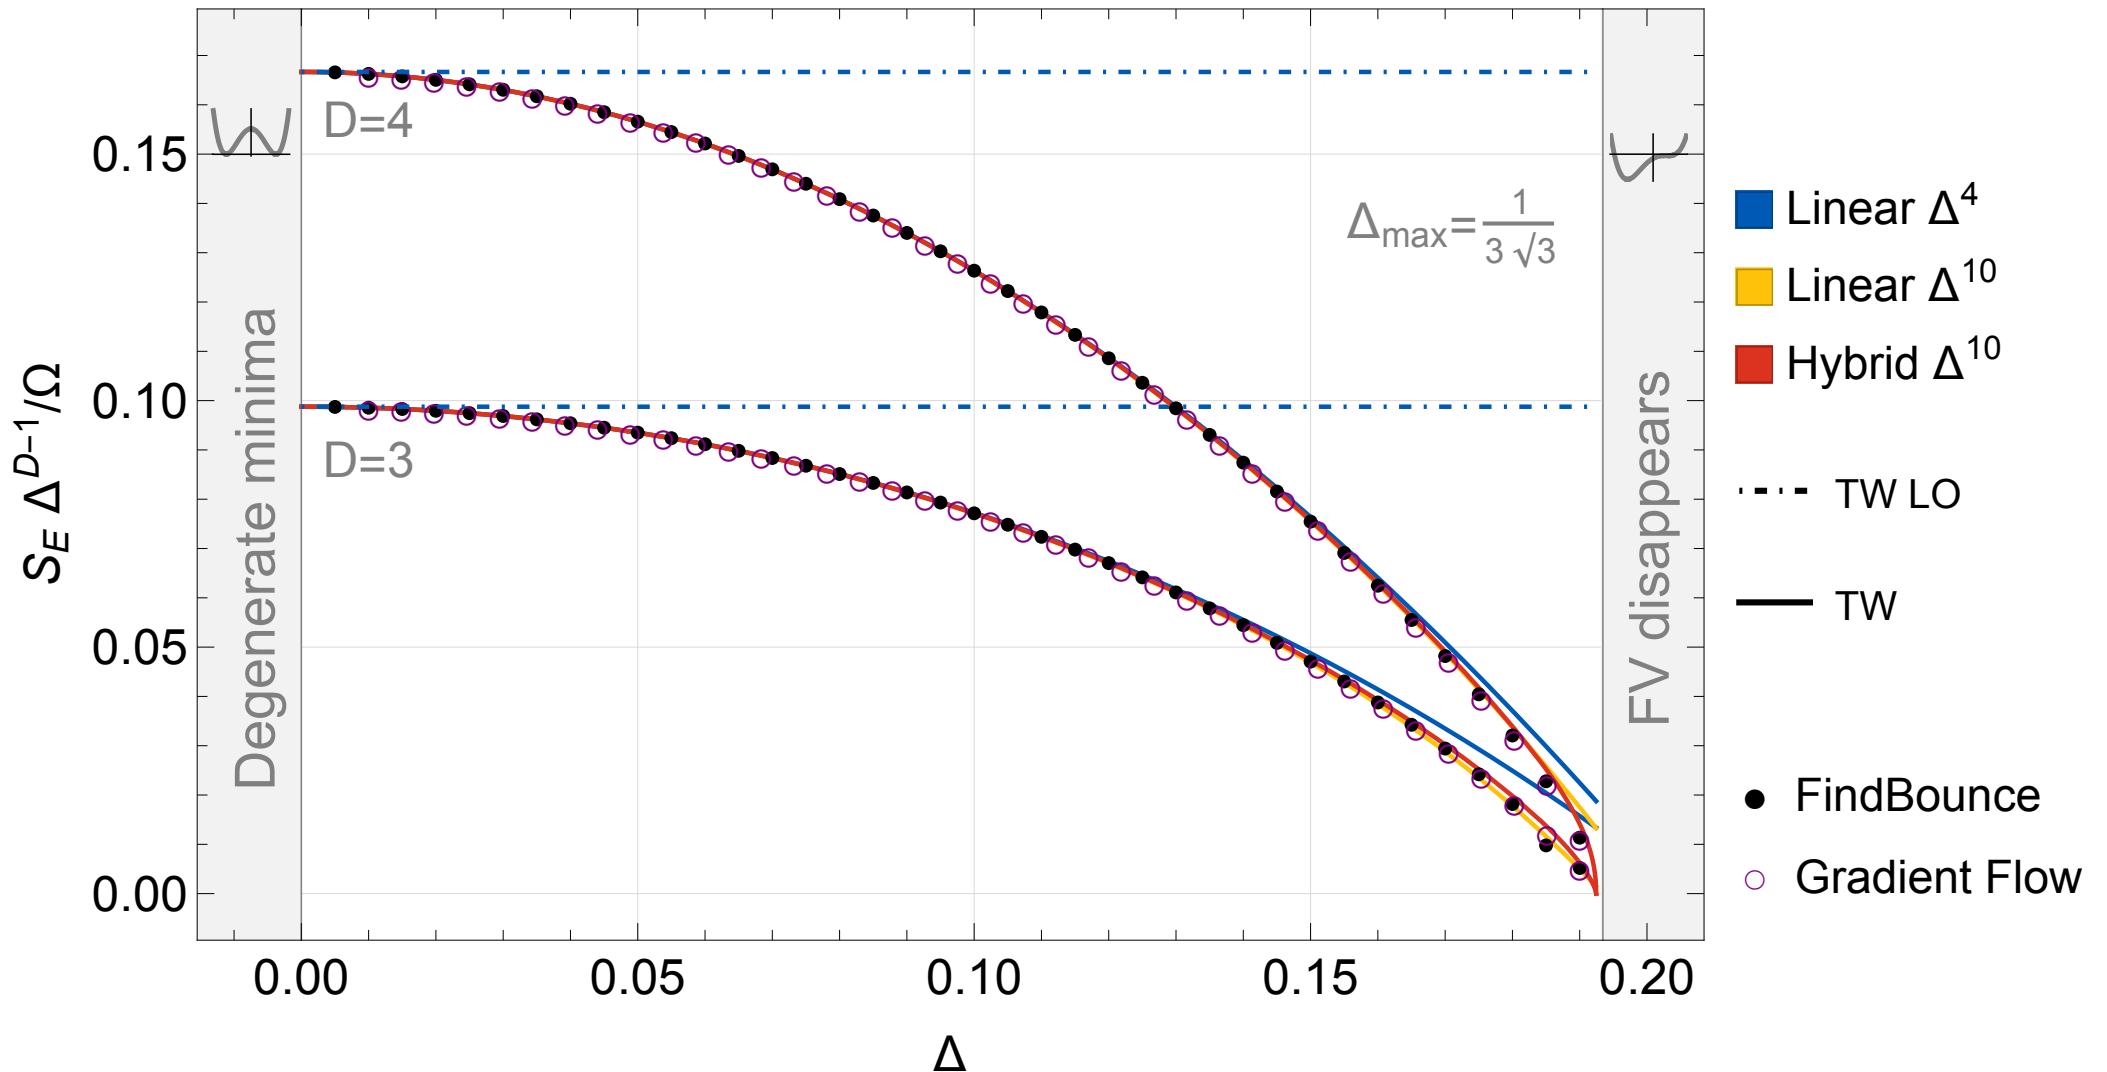

Higher orders: analytic  $\Delta^4$ , semi-analytic up to  $\Delta^{10}$

Matteini, MN, Shoji, Ubaldi '23

# Thin -> thick Wall Action

Matteini, MN, Shoji, Ubaldi '23

Linear and cubic potentials different outside TW

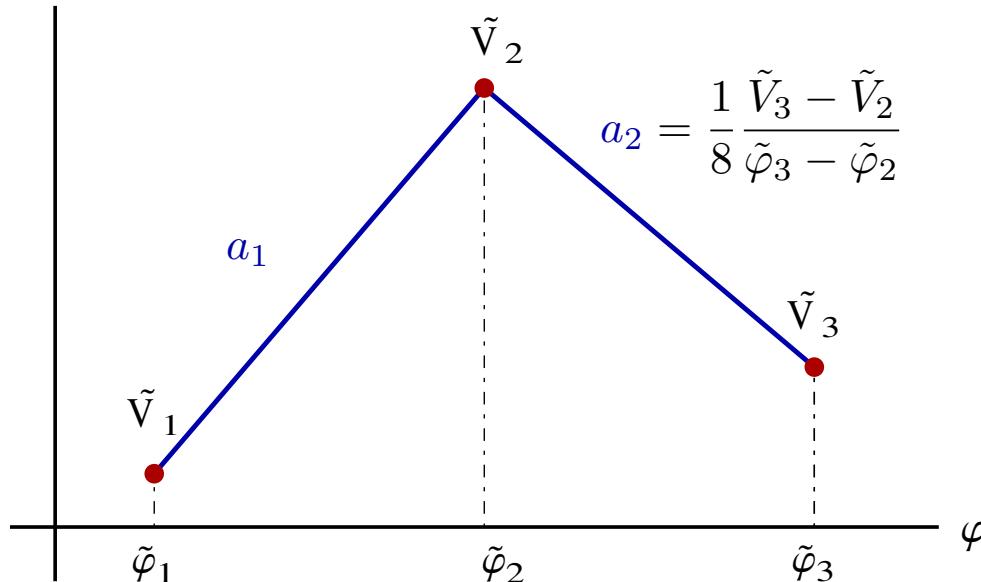

Possible to create a hybrid approach, good near inflection

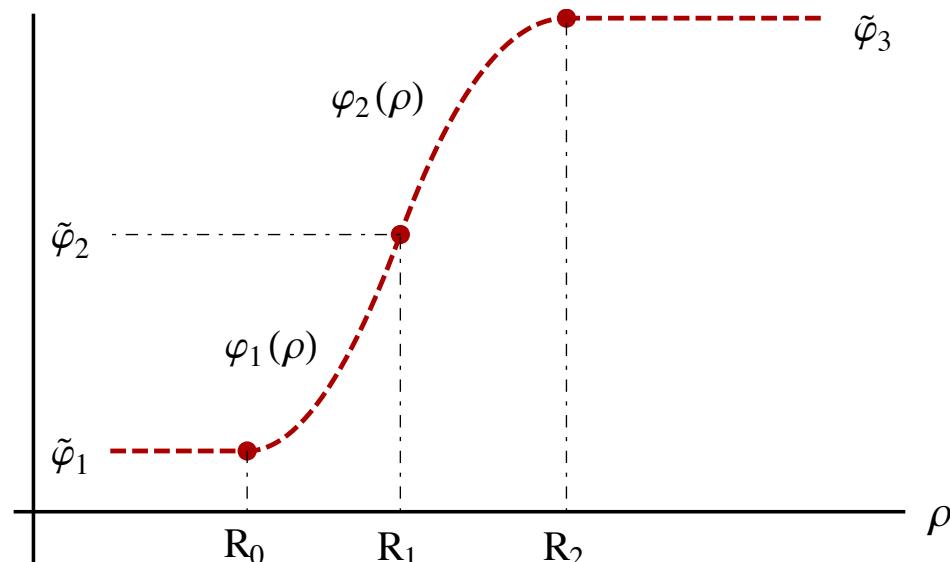

# Polygonal bounces

# Triangle

$V(\varphi)$

$\varphi(\rho)$

Linear potentials

- triangle and box

Duncan, Jensen '92

Exact solution

$$\ddot{\varphi} + \frac{3}{\rho} \dot{\varphi} = dV = 8 \textcolor{blue}{a}$$

$$\varphi = \textcolor{red}{v} + \textcolor{blue}{a} \rho^2 + \frac{\textcolor{green}{b}}{\rho^2}$$

Initial conditions @  $R_0$

shoot in  $\varphi_0$  or  $R_0$

- a)  $\varphi_1(0) = \varphi_0, \quad \dot{\varphi}_1(0) = 0$

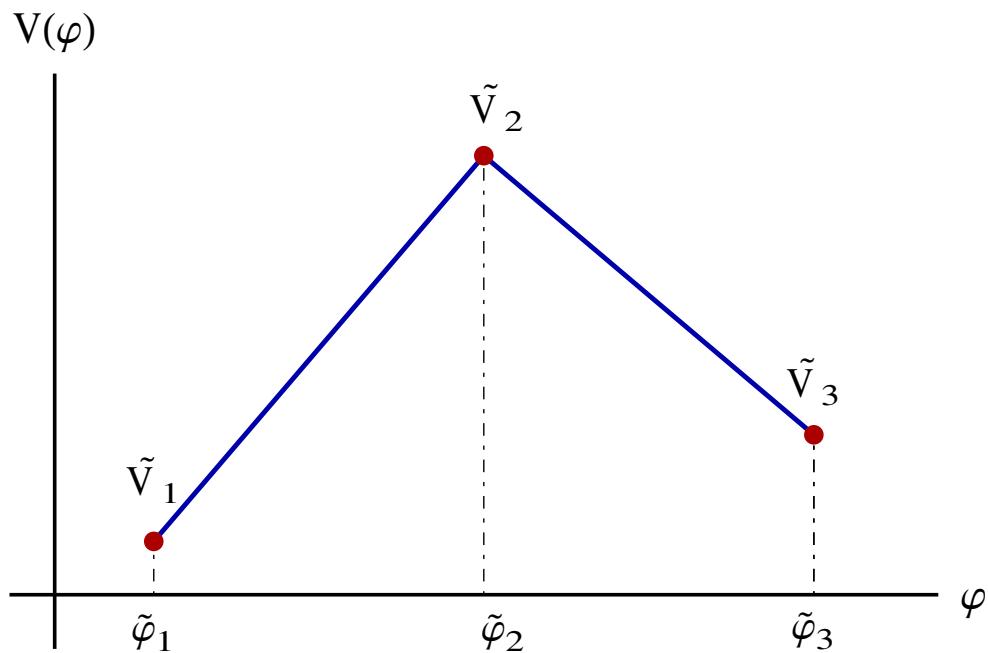

$$\textcolor{red}{v}_1 = \varphi_0, \quad \textcolor{green}{b}_1 = 0$$

- b)  $\varphi_1(R_0) = \tilde{\varphi}_1, \quad \dot{\varphi}_1(R_0) = 0$

$$\textcolor{red}{v}_1 = \tilde{\varphi}_1 - 2 \textcolor{blue}{a}_1 R_0^2, \quad \textcolor{green}{b}_1 = \textcolor{blue}{a}_1 R_0^4$$

# Triangle summary

Duncan, Jensen '92

Complete exact analytic solution in  
 $D=4$  for two segments

Solved in terms of Euclidean radius

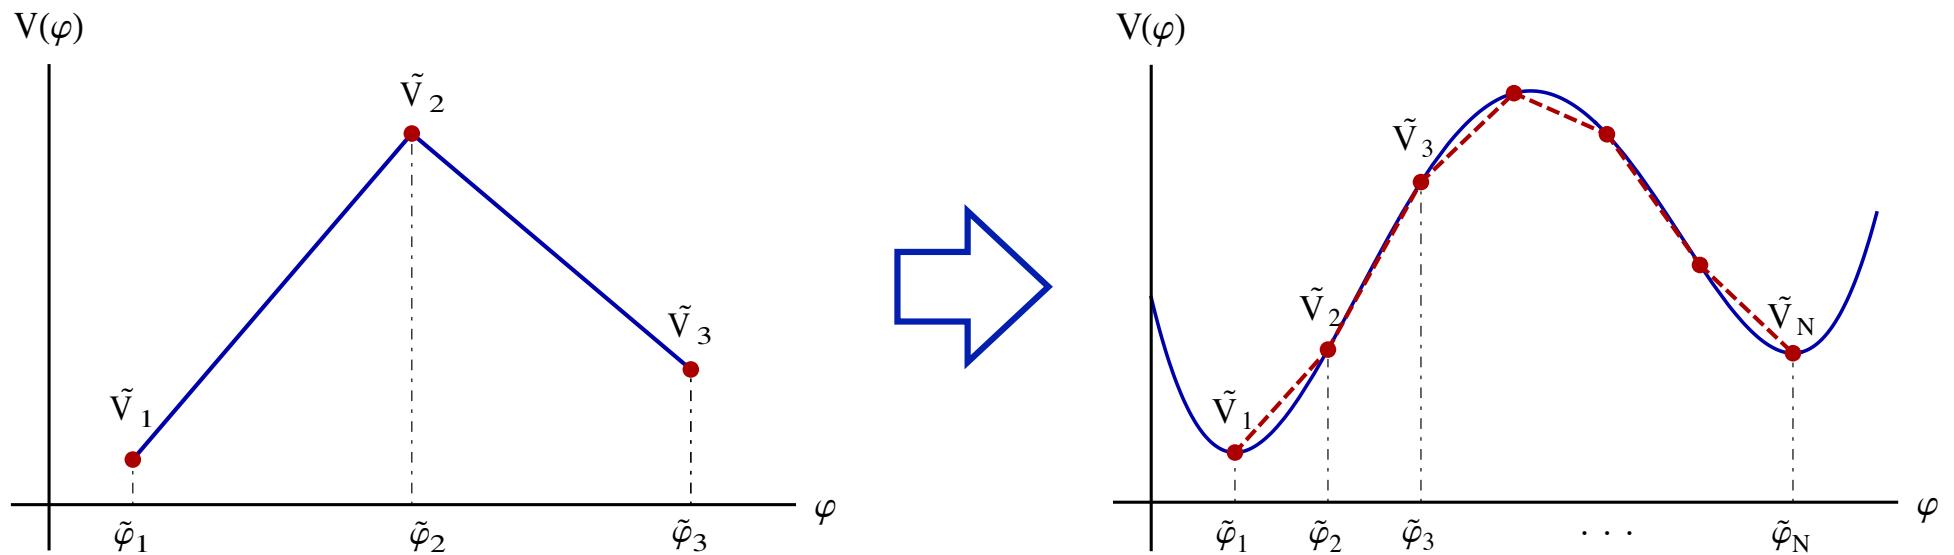

Stable in thin wall, goes over to TW

Limited validity outside the TW

# Polygonal bounces

Extend to more segments and  $D$  dimensions

Guada, Maiezza, MN '18

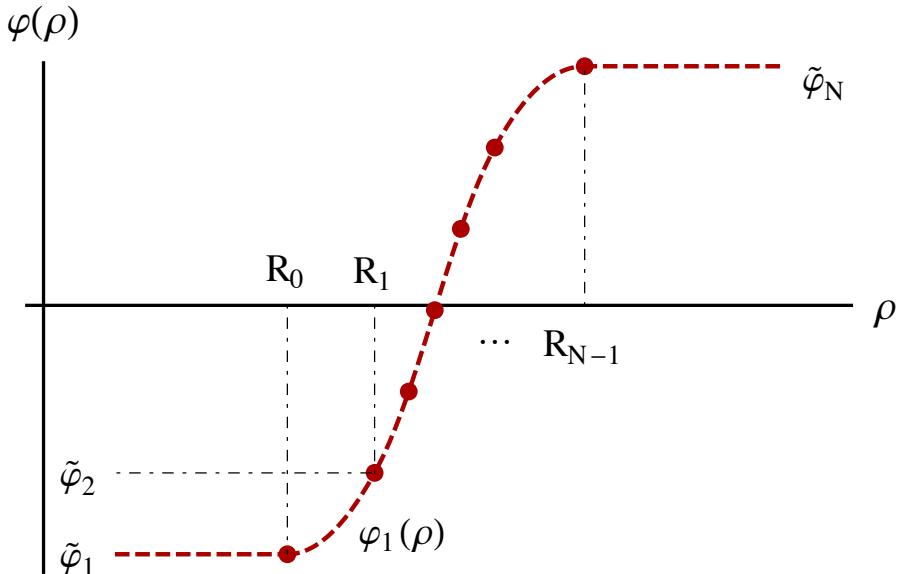

Approximates any  $V$  when  $N \rightarrow \infty$ , with controlled precision

Geometric insight of segmentation, cover non-trivial features/unstable Vs

Semi-analytic solution for algebraic manipulation/deformation

# Polygonal construction

$$\ddot{\varphi}_i + \frac{D-1}{\rho} \dot{\varphi}_i = dV_i = 8 \textcolor{blue}{a}_i$$

$$\varphi_i = \textcolor{red}{v}_{\textcolor{red}{i}} + \frac{4}{D} \textcolor{blue}{a}_i \rho^2 + \frac{2}{D-2} \frac{\textcolor{green}{b}_i}{\rho^{D-2}}$$

Initial/final conditions remain the same

Matching conditions @  $R_i$     3 parameters and 3 unknowns/segment    Guada, Maiezza, MN '18

$$\varphi_i(R_1) = \varphi_{i+1}(R_i) = \tilde{\varphi}_{i+1}, \quad \dot{\varphi}_i(R_i) = \dot{\varphi}_{i+1}(R_i)$$

The bounce is defined recursively

- a)  $R_0 = 0$

$$\textcolor{red}{v}_n = \varphi_0 - \frac{4}{D-2} \left( a_1 R_0^2 + \sum_{i=1}^{n-1} (\textcolor{blue}{a}_{i+1} - \textcolor{blue}{a}_i) R_i^2 \right)$$

- b)  $\varphi_0 = \tilde{\varphi}_1$

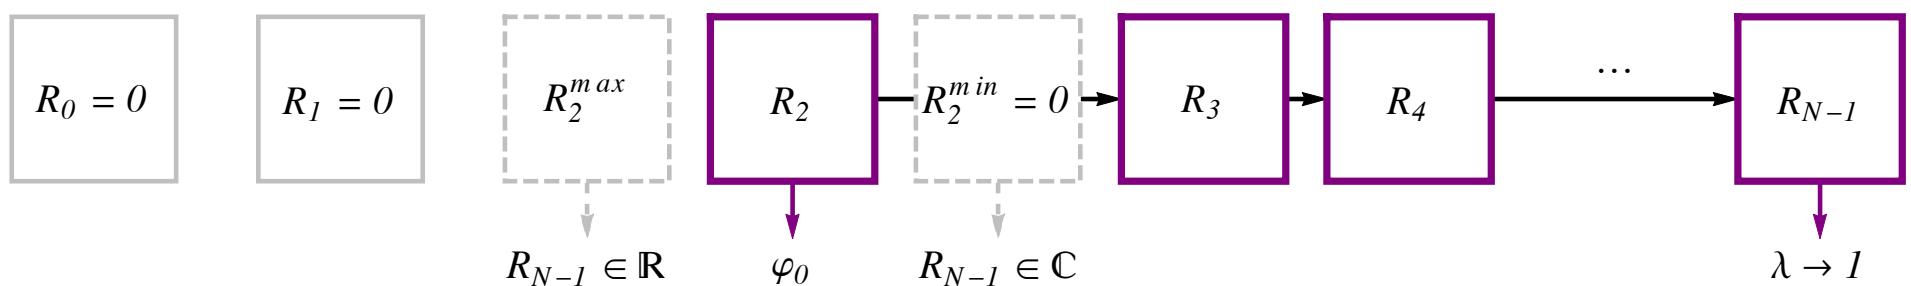

$$\textcolor{green}{b}_n = \frac{4}{D} \left( a_1 R_0^D + \sum_{i=1}^{n-1} (\textcolor{blue}{a}_{i+1} - \textcolor{blue}{a}_i) R_i^D \right)$$

Radii computed at each segment from matching the fields  $\varphi_n(R_n) = \tilde{\varphi}_{n+1}$

fewnomial for  $R_n$

$$R_n^D - \frac{D}{4} \frac{\delta_n}{a_n} R_n^{D-2} + \frac{D}{2(D-2)} \frac{b_n}{a_n} = 0 \quad \delta_n = \tilde{\varphi}_{n+1} - v_n$$

require real positive roots

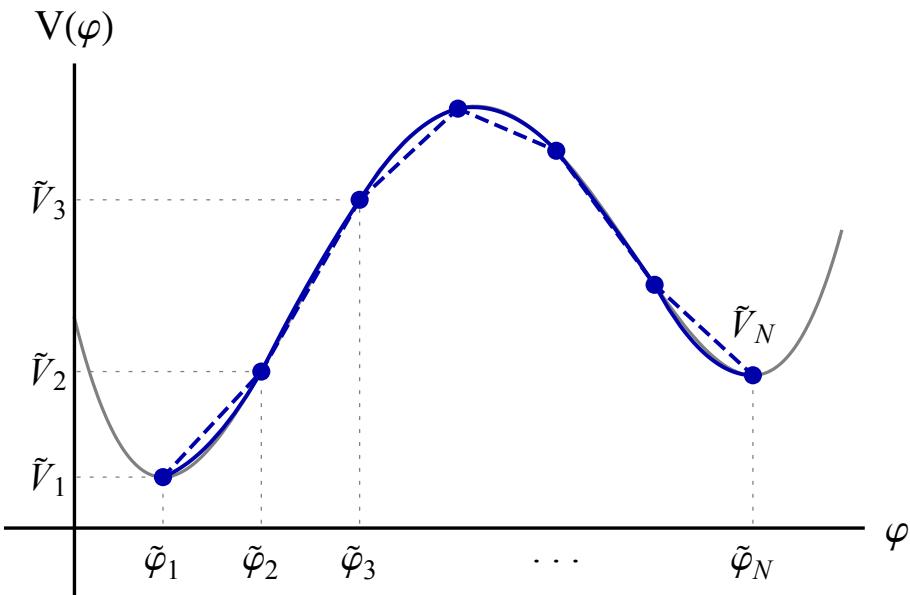

radii solutions  $D = 3 :$   $2R_n = \frac{1}{\sqrt{a_n}} \left( \frac{\delta_n}{\xi} + \xi \right), \quad \xi^3 = \sqrt{36a_n b_n^2 - \delta_n^3} - 6\sqrt{a_n} b_n,$  simple cubic

$$D = 4 : \quad 2R_n^2 = \frac{1}{a_n} \left( \delta_n + \sqrt{\delta_n^2 - 4a_n b_n} \right) \quad \text{quadratic}$$

$D = 2, 6, 8$  in the paper, other  $Ds$  possible numerically

Amariti '20

# Higher orders

Expand to higher orders

- improves convergence
- important @ extrema

$$\begin{aligned} \text{---} & \quad V_i \simeq \tilde{V}_i - \tilde{V}_N + \partial \tilde{V}_i (\varphi_i - \tilde{\varphi}_i) \\ \text{—} & \quad + \frac{\partial^2 \tilde{V}_i}{2} (\varphi_i - \tilde{\varphi}_i)^2 \end{aligned}$$

Perturbative expansion       $\varphi = \varphi_{PB} + \xi$

$$\ddot{\xi} + \frac{D-1}{\rho} \dot{\xi} = 8(\alpha + \textcolor{blue}{\alpha}) + \delta dV(\varphi_{PB}(\rho))$$

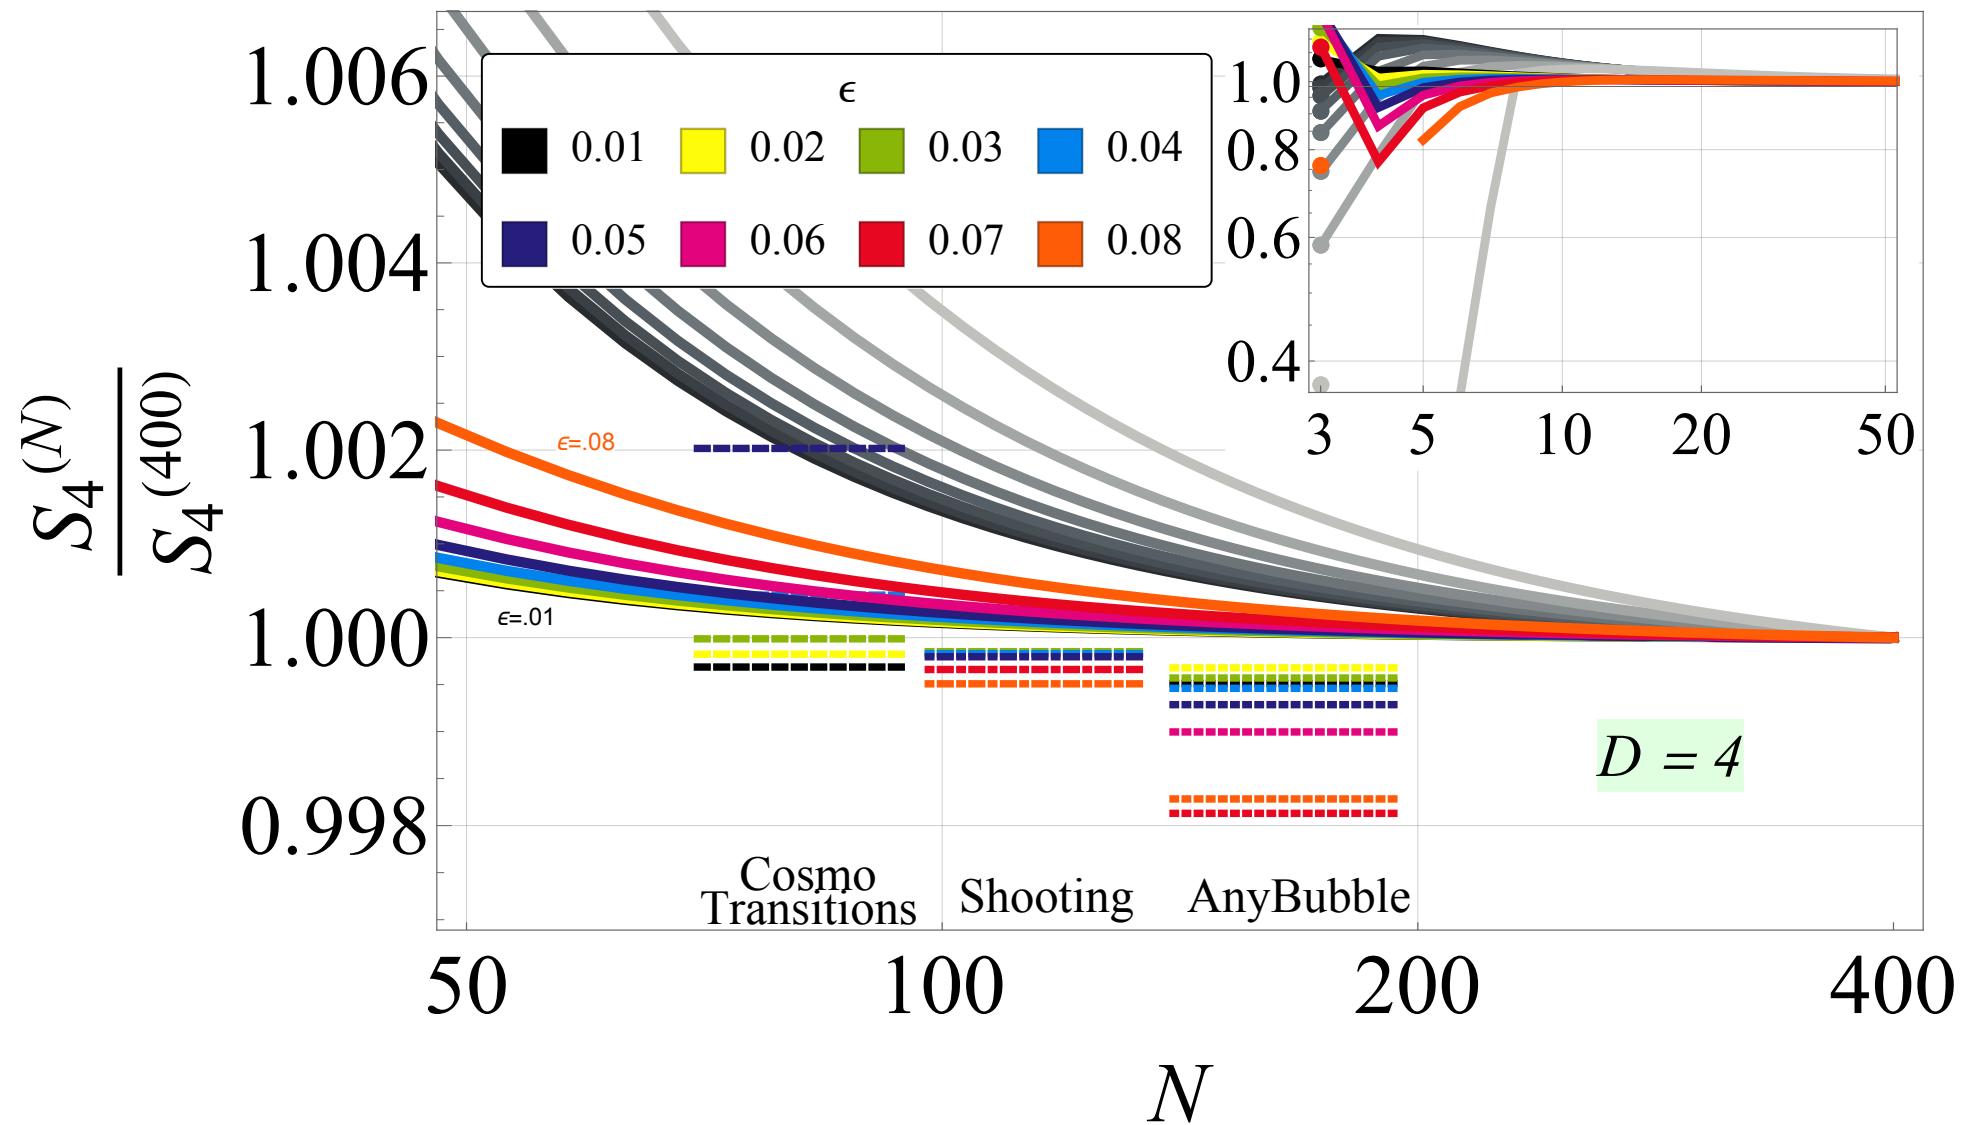

$$\ddot{\xi} + \frac{D-1}{\rho} \dot{\xi} = 8\textcolor{blue}{\alpha} + \delta dV(\rho)$$

$$\xi = \textcolor{red}{v} + \frac{2}{D-2} \frac{\beta}{\rho^{D-2}} + \frac{4}{D} \alpha \rho^2 + \mathcal{I}(\rho)$$

$$\mathcal{I}_s^{D=4} = \partial^2 \tilde{V}_s \left( \frac{\textcolor{red}{v}_s - \tilde{\varphi}_s}{8} \rho^2 + \frac{\textcolor{green}{b}_s}{2} \ln \rho + \frac{\textcolor{blue}{a}_s}{24} \rho^4 \right)$$

$$V(\varphi) = \frac{\lambda}{8} (\varphi^2 - v^2)^2 + \varepsilon \left( \frac{\varphi - v}{2v} \right)$$

Guada, Maiezza, MN '18

# Multi-fields

$$\ddot{\varphi}_i + \frac{D-1}{\rho} \dot{\varphi}_i = \frac{dV}{d\varphi_i}$$

# Polygonal approach with many fields

Guada, Maiezza, MN '18

- Initial ansatz straight line, via saddle, custom segmentation
- Initial solution longitudinal single field PB

Crucial idea #1

- perturbation up to linear term in V, keeps the PB

$$\underbrace{\ddot{\bar{\varphi}}_{is} + \frac{D-1}{\rho} \dot{\bar{\varphi}}_{is}}_{8\bar{a}_{is}} + \underbrace{\ddot{\zeta}_{is} + \frac{D-1}{\rho} \dot{\zeta}_{is}}_{8a_{is}} = \frac{dV}{d\varphi_i} (\bar{\varphi} + \zeta)$$

$$\zeta_{is} = \textcolor{red}{v_{is}} + \frac{2}{D-2} \frac{\textcolor{green}{b_{is}}}{\rho^{D-2}} + \frac{4}{D} \textcolor{blue}{a_{is}} \rho^2$$

$$\underbrace{\ddot{\varphi}_{is} + \frac{D-1}{\rho} \dot{\varphi}_{is}}_{8\bar{a}_{is}} + \underbrace{\ddot{\zeta}_{is} + \frac{D-1}{\rho} \dot{\zeta}_{is}}_{8a_{is}} = \frac{dV}{d\varphi_i} (\bar{\varphi} + \zeta) \quad \text{Guada, Maiezza, MN '18}$$

Crucial idea #2

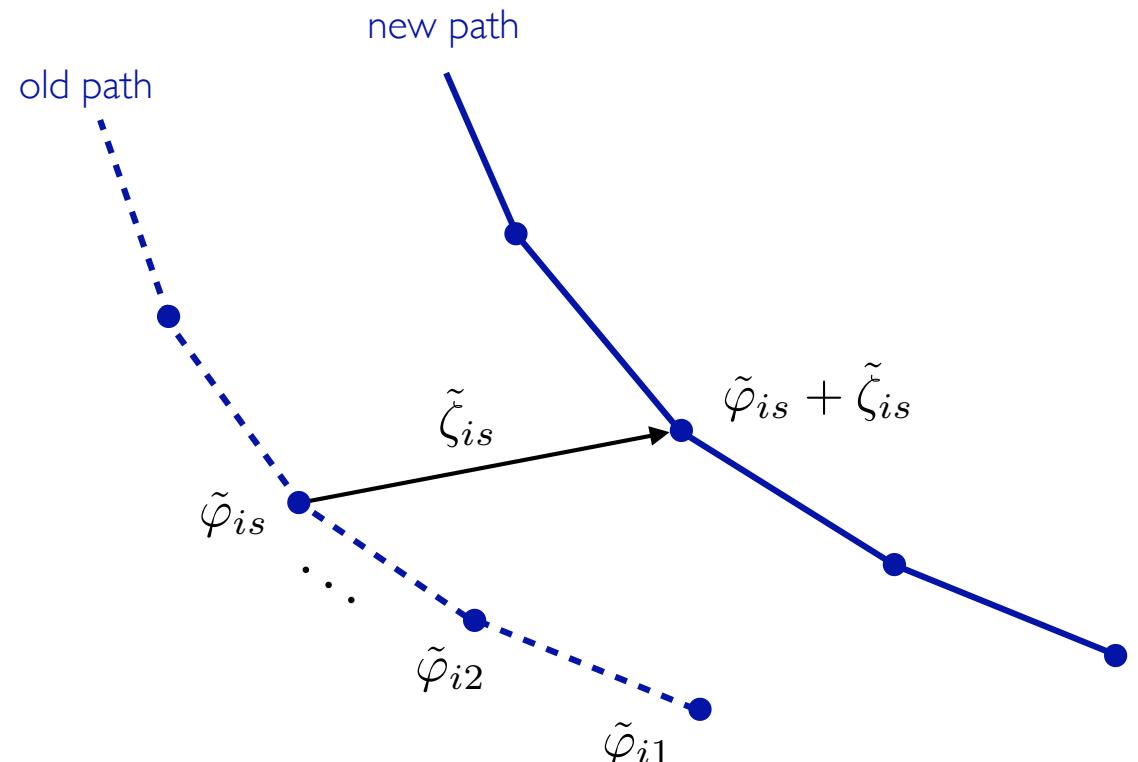

$$8a_{is} \simeq \frac{dV}{d\varphi_i} (\tilde{\varphi}_{is} + \tilde{\zeta}_{is}) - 8\bar{a}_{is}$$

$$\frac{dV}{d\varphi_i} \simeq \frac{1}{2} \left( d_i \tilde{V}_s + d_i \tilde{V}_{s+1} + d_{ij}^2 \tilde{V}_s \tilde{\zeta}_{js} + d_{ij}^2 \tilde{V}_{s+1} \tilde{\zeta}_{js+1} \right)$$

- simultaneous solution for the bounce and path deformation

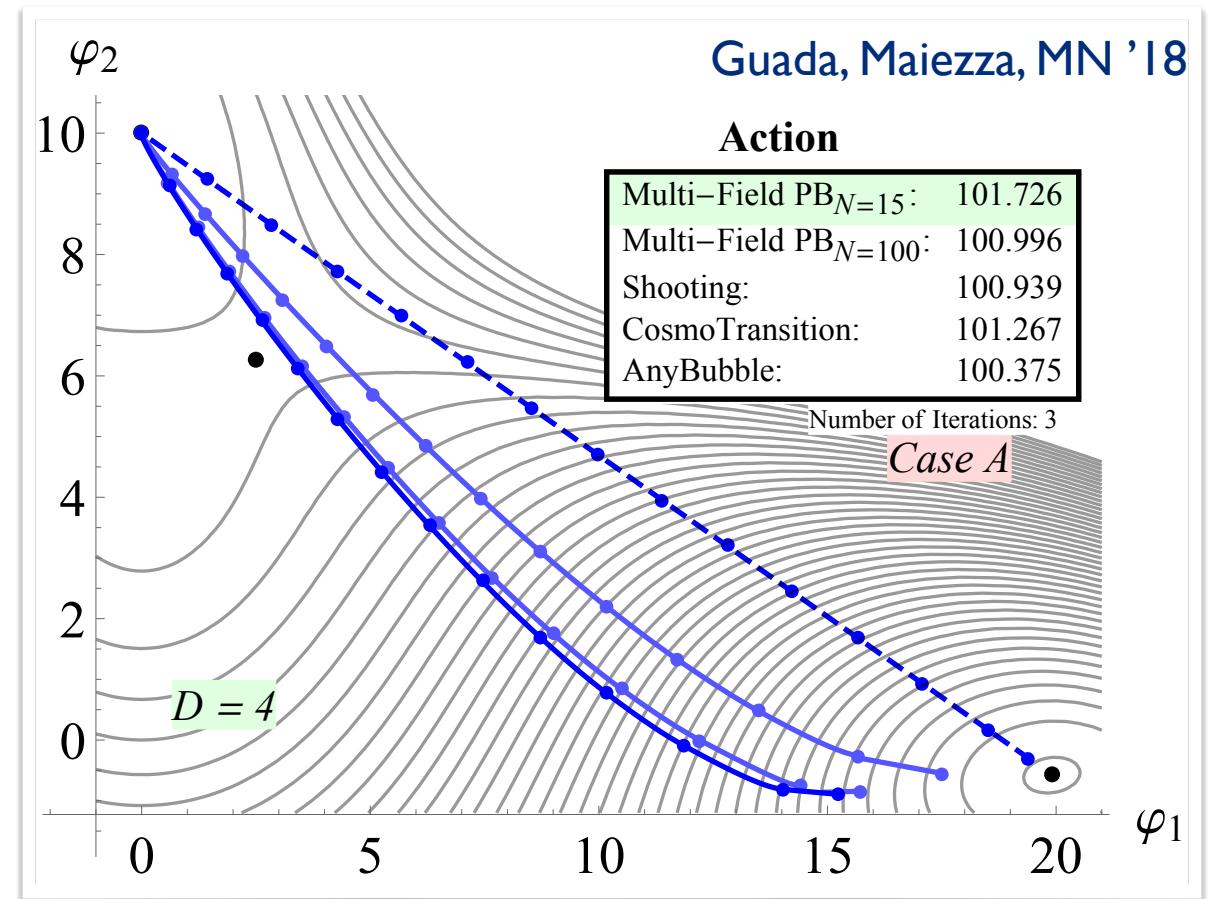

- linear system for  $r_{i0}$  (as in the single field expansion) and  $\tilde{\zeta}_{is}$

- iterate until  $\tilde{\zeta}_{is} < \varepsilon_{\Delta\varphi}$

$$V(\varphi_i) = \sum_{i=1}^2 (-\mu_i^2 \varphi_i^2 + \lambda_i^2 \varphi_i^4) + \lambda_{12} \varphi_1^2 \varphi_2^2 + \tilde{\mu}^3 \varphi_2$$

- no oscillations
- converges in a few iterations
- works for thin wall
- works for  $D=3$  and 4
- tested for up to 20 fields

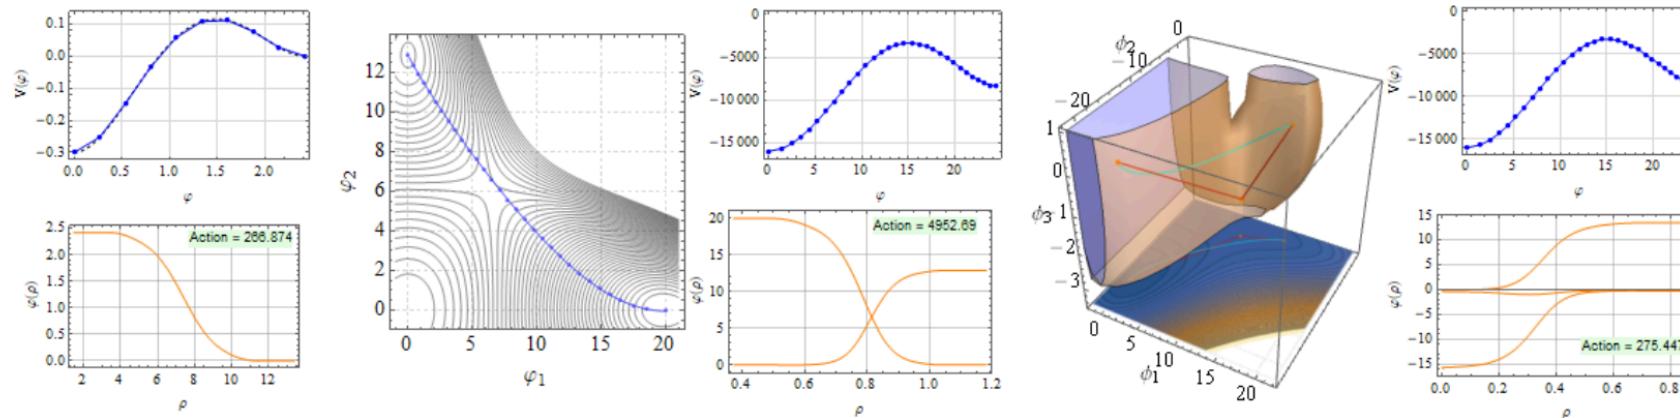

FindBounce

# FindBounce <https://github.com/vguada/FindBounce/releases>

*FindBounce* is a [Mathematica](#) package that computes the bounce configuration needed to compute the false vacuum decay rate with multiple scalar fields.

We kindly ask the users of the package to cite the two papers that describe the working of the *FindBounce* package: the paper with the original proposal by [Guada, Maiezza and Nemevšek \(2019\)](#) and the software release manual by [Guada, Nemevšek and Pintar \(2020\)](#).

## Installation

To use the *FindBounce* package you need Mathematica version 10.0 or later. The package is released in the `.paclet` file format that contains the code, documentation and other necessary resources. Download the latest `.paclet` file from the repository "[releases](#)" page to your computer and install it by evaluating the following command in the Mathematica:

```
(* Path to .paclet file downloaded from repository "releases" page. *)
PacletInstall["full/path/to/FindBounce-X.Y.Z.paclet"]
```

Load the package as usual

Guada, MN, Pintar '20

```
In[1]:= Needs["FindBounce`"]
```

Define a metastable potential

```
In[2]:= V[x_]:= 0.5 x^2 + 0.5 x^3 + 0.12 x^4;
```

```
In[3]:= extrema = x/.Sort@Solve[D[V[x],x]==0];
```

Compute the bounce - obtain bf = the bounce function

```
In[4]:= bf = FindBounce[V[x],x,{extrema[[1]],extrema[[3]]}]

\* Polygonal bounce

Guada, Maiezza, MN '18

\* Quartic-quartic

Guada, MN '20

$$\frac{\Gamma}{\mathcal{V}} = \left( \frac{S_R}{2\pi\hbar} \right)^{\frac{D}{2}} \left| \frac{\det' \mathcal{O}}{\det \mathcal{O}_{FV}} \right|^{-\frac{1}{2}} e^{-\frac{S_R}{\hbar} - S_{ct}} (1 + \mathcal{O}(\hbar))$$

$\mathcal{O} = -\partial_\mu \partial^\mu + V^{(2)}$  fluctuations around the bounce

Bubble deformation, zeroes for symmetries, single negative

a) Renormalized bounce action and counter-terms

b) Functional determinant

Pedagogical notes on functional determinants

Dunne '07

c) Zero removal

$\det' \mathcal{O}$

## a) Renormalized bounce action

Guada, Ivanov, MN, Ubaldi '21

At one loop, the action needs counter-terms

Peskin & Schröder

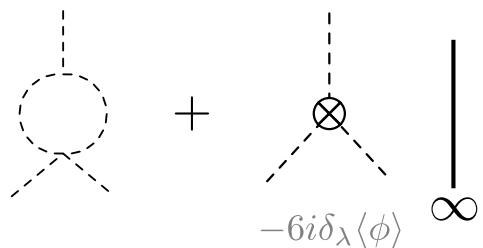

$$V_{\text{ct}} = \frac{\delta_{m^2}}{2} \phi^2 + \frac{\delta_\lambda}{4} \phi^4, \quad \langle \phi \rangle = \frac{\mu}{\sqrt{\lambda}}, \quad V^{(n)} \equiv \frac{d^n V}{d\phi^n}(\langle \phi \rangle)$$

$$\delta_\lambda = \frac{1}{32\pi^2 \varepsilon} V^{(4)2} \quad \text{set by the 4-p function}$$

$$+ \quad \begin{array}{c} \text{---} \\ \otimes \\ \text{---} \end{array} \quad \begin{array}{c} -6i\delta_\lambda \\ \infty \end{array} = 0 \quad \varepsilon = 4 - D$$

cancels the 3-p

$$= 0 \quad \text{if} \quad V^{(3)} = V^{(4)} \langle \phi \rangle$$

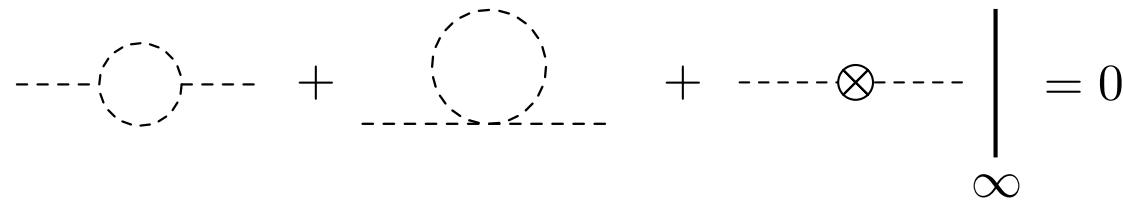

automatic if 3-p interactions comes from a single quartic

$$V^{(4)} = 4! \lambda, \quad V^{(3)} = 4 \times 3! \lambda \langle \phi \rangle = V^{(4)} \langle \phi \rangle$$

Remove the tadpoles...  +   = 0

$$\delta_{m^2} = \frac{1}{(4\pi)^2 \varepsilon} V^{(4)} \left( V^{(2)} - \frac{1}{2} V^{(4)} \langle \phi \rangle^2 \right)$$

...and the 2-p mass divergence cancels out

$$\langle \phi \rangle \simeq v (1 - \Delta + \dots)$$

the vev shifts

$$\delta_\lambda = \frac{9\lambda^2}{(4\pi)^2 2\varepsilon},$$

$$\delta_{m^2} = -\frac{3\lambda^2 v^2}{(4\pi)^2 2\varepsilon}$$

independent of  $\Delta$

$\Delta$  counter-term is zero, and does not run (2 loops?)

## a) Renormalized bounce action and counter-terms

Counter-term for the Euclidean action

$$S_{\text{ct}} = \int_D (V_{\text{ct}} - V_{\text{ctFV}}) = \frac{3\lambda^2}{8(4\pi)^2 \varepsilon} \int_D (3(\phi^4 - \phi_{\text{FV}}^4) - 2v^2(\phi^2 - \phi_{\text{FV}}^2)) \simeq -\frac{3}{16\varepsilon\Delta^3}.$$

Running of the Euclidean action

$$S_R + S_{\text{ct}} = S \left( 1 - \frac{9\lambda_0}{(4\pi)^2} \left( \frac{1}{\varepsilon} + \ln \frac{\mu}{\mu_0} \right) \right)$$

**Non-trivial check:** the  $\frac{1}{\varepsilon}$  pole and  $\ln \mu$  cancel with the determinant

## b) Functional determinant

We wish to get the eigenvalues of  $O$  and multiply them

The bounce and fluctuations are spherically symmetric, orbital decomposition

$$\left| \frac{\det' \mathcal{O}}{\det \mathcal{O}_{\text{FV}}} \right|^{-\frac{1}{2}} = \left| \prod_{l=0}^{\infty} \frac{\det' \mathcal{O}_l}{\det \mathcal{O}_{l\text{FV}}} \right|^{-\frac{1}{2}}$$

$$\mathcal{O}_l = -\frac{d^2}{d\rho^2} - \frac{D-1}{\rho} \frac{d}{d\rho} + \frac{l(l+D-2)}{\rho^2} + V^{(2)}, \quad V^{(2)} = \frac{d^2V}{d\varphi^2} \Big|_{\bar{\varphi}}$$

Gel'fand-Yaglom theorem (appendix)

$$\begin{aligned} \mathcal{O}_l \psi_l &= 0, & \psi_l(0) &\sim \rho^l \\ \mathcal{O}_{l\text{FV}} \psi_{l\text{FV}} &= 0, & \psi_{l\text{FV}}(0) &\sim \rho^l \end{aligned}$$

$$\frac{\det \mathcal{O}_l}{\det \mathcal{O}_{l\text{FV}}} = \left( \frac{\psi_l}{\psi_{l\text{FV}}} \Big|_\infty \right)^{d_l}$$

$$d_l = \frac{(2l+D-2)(l+D-3)!}{l!(D-2)!} \quad \text{degeneracy} \quad \begin{aligned} d_0 &= 1 \\ d_1 &= D \end{aligned}$$

## Fluctuations

Define the ratio  $R_l \equiv \frac{\psi_l}{\psi_{l\text{FV}}}$  and solve the stable equation

$$\ddot{R}_l + 2 \left( \frac{\dot{\psi}_{l\text{FV}}}{\psi_{l\text{FV}}} \right) \dot{R}_l = \left( V^{(2)} - V_{\text{FV}}^{(2)} \right) R_l$$

$$\psi_{l\text{FV}}(0) \sim \rho^l, \quad R_l(0) = 1, \quad \dot{R}_l(0) = 0$$

IR  $l \sim 1$

$l$

UV  $l \gg 1$

Low multipoles  $l < \frac{1}{\Delta}$

Multiplicative TW expansion

$$R_l = \prod_{n \geq 0} R_{ln}^{\Delta^n} \quad x = e^z$$

$$R_{l0} = \frac{1}{(1+x)^2},$$

$$\ln R_{l1} = 3(r + \ln x),$$

$$\ln R_{l2}(x \rightarrow \infty) = \frac{3}{4} \frac{(l-1)(l+D-1)}{(D-1)^2} x^2$$

$$R_l(\infty) = \Delta^2 e^{D-1} \frac{3}{4} \frac{(l-1)(l+D-1)}{(D-1)^2}$$

Negative and zero modes ok

IR  $l \sim 1$  $l$ UV  $l \gg 1$ 

High multipoles  $l \gg \frac{1}{\Delta}$

Shift multipoles

$$\nu = l + \frac{D}{2} - 1$$

FV part

$$\psi_{\nu FV} \simeq e^{k_\nu z}, \quad k_\nu^2 = 1 + \frac{\Delta^2 \nu^2}{r_0^2}$$

Leading order

$$R_{\nu 0}(\infty) = \frac{(k_\nu - 1)(2k_\nu - 1)}{(k_\nu + 1)(2k_\nu + 1)}$$

$$\ln R_\nu(\infty) = \ln \frac{(k_\nu - 1)(2k_\nu - 1)}{(k_\nu + 1)(2k_\nu + 1)} + 3r_0 \left( k_\nu - \sqrt{k_\nu^2 - 1} \right)$$

'All-order' corrections

Correct UV behaviour

$$\lim_{\nu \rightarrow \infty} R_\nu(\infty) = 1 \quad \text{not low-}l, \text{ though, as expected}$$

## Renormalized determinant

$$\sum = \sum_{\text{fin}} - \sum_l - \sum_{\text{asym}} + \sum_{\text{ren}}$$

needs  $R_\nu$

Two approaches (different power counting)

1a) organize in multipoles, minimal subtraction

$$\sum_{\text{asym}} \sim \#_1 \nu + \#_2 \frac{1}{\nu}$$

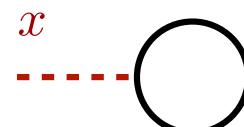

quadratic      log divergence

1b) organize in coupling  $x$  insertion

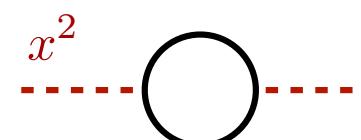

$$\sum_{\text{asym}} \sim \#_1 x + \tilde{\#}_2 x^2$$

Renormalize - replace divergencies with  $\overline{\text{MS}}$  and introduce  $\mu$

2a)  $\zeta$  function

2b) Feynman diagrams

$$\sum_{\text{ren}} \propto \frac{1}{\varepsilon} + \ln \mu + \text{fin}$$

# Renormalized determinant

Sum over multipoles

$$\ln \left( \frac{\det \mathcal{O}}{\det \mathcal{O}_{\text{FV}}} \right) = \sum_{\nu=D/2-1}^{\infty} d_{\nu} \ln R_{\nu}, \quad d_{\nu} \simeq \frac{2}{(D-2)!} \nu^{D-2}$$

Diverges in the UV as expected from QFT

$$\sum_{\nu \gg 1} d_{\nu} \ln R_{\nu \gg 1} \sim -\frac{3r_0(2-r_0)}{(D-2)!\Delta} \sum_{\nu \gg 1} \nu^{D-2} \left( \frac{1}{\nu} - \frac{1}{\nu^3} \left( \frac{r_0}{2\Delta} \right)^2 \right)$$

quadratic and log in  $D=4$

Finite sum

$$\Sigma_D = \sum_{\nu=\nu_0}^{\infty} \sigma_D = \sum_{\nu=\nu_0}^{\infty} d_{\nu} (\ln R_{\nu} - \underline{\ln R_{\nu}^a})$$

asymptotic subtraction

Renormalized determinants

## Renormalized determinant $D=4$

$$\ln \left( \frac{\det \mathcal{O}}{\det \mathcal{O}_{\text{FV}}} \right) = \sum_{\nu} \nu^2 \left( \ln R_{\nu} - \frac{1}{2\nu} I_1 + \frac{1}{8\nu^3} I_2 \right) - \frac{1}{8} \tilde{I}_2$$

Asymptotic subtractions remove first two divergencies in any  $D$

$$I_1 = \int_0^\infty d\rho \rho \left( V^{(2)} - V_{\text{FV}}^{(2)} \right) \simeq -3(2 - r_0) \left( \frac{r_0}{\Delta} \right),$$

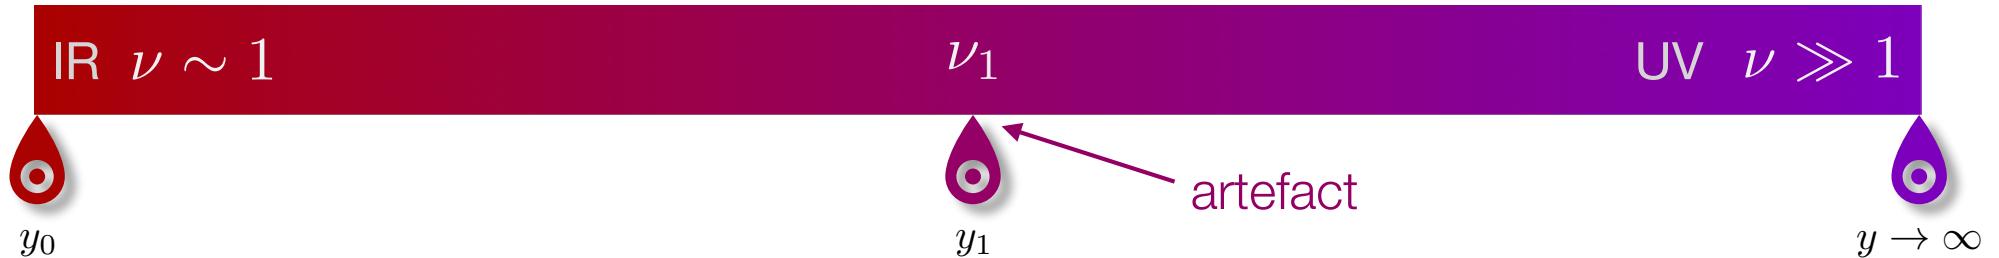

$$I_2 = \int_0^\infty d\rho \rho^3 \left( V^{(2)2} - V_{\text{FV}}^{(2)2} \right) \simeq -3(2 - r_0) \left( \frac{r_0}{\Delta} \right)^3$$

The renormalized piece gives the pole and the log scale part (and a finite piece, the 5/4)

$$\begin{aligned} \tilde{I}_2 &= \int_0^\infty d\rho \rho^3 \left( V^{(2)2} - V_{\text{FV}}^{(2)2} \right) \left( \frac{1}{\varepsilon} + \gamma_E + 1 + \ln \left( \frac{\mu\rho}{2} \right) \right) \\ &\simeq I_2 \left( \frac{1}{\varepsilon} + \gamma_E + \frac{5}{4} + \ln \left( \frac{\mu r_0}{2\sqrt{\lambda} v \Delta} \right) \right) \end{aligned}$$

Final sum done by Euler-Maclaurin, dominated by *large* multipoles, use  $y = \frac{\Delta\nu}{r_0}$

$$\Sigma_4^f \simeq \frac{1}{\Delta^3} \int_{y_0}^{\infty} dy y^2 \left( \ln R_\nu + \frac{3}{2y} - \frac{3}{8y^3} \right) = \frac{3}{8\Delta^3} \left( \frac{9 - 4\sqrt{3}\pi}{36} + \ln 2y_0 \right)$$

Separate low and high at arbitrary intermediate multipole  $\nu_1$

$$\Sigma_D = \Sigma_D^{\text{low}} + \Sigma_D^{\text{high}} = \sum_{\nu=\nu_0}^{\nu_1} \sigma_D + \sum_{\nu=\nu_1+1}^{\infty} \sigma_D$$

Combining low and high, we get the finite sum

$$\Sigma_4 = \frac{3}{8\Delta^3} \left( \frac{9 - 4\sqrt{3}\pi}{36} - \gamma_E + \ln 2\Delta \right) \rightarrow \ln \left( \frac{\det \mathcal{O}}{\det \mathcal{O}_{\text{FV}}} \right) = \Sigma_4 - \frac{\tilde{I}_2}{8}$$

The  $\gamma_E$  and  $\ln \Delta$  cancel with parts in  $\tilde{I}_2 \simeq I_2 \left( \frac{1}{\varepsilon} + \gamma_E + \frac{5}{4} + \ln \left( \frac{\mu r_0}{2\sqrt{\lambda} v \Delta} \right) \right)$

# TW rate at one loop - summary

Ivanov, Matteini, MN, Ubaldi '22

Explicit closed form renormalized rate at one loop  $\mu_0 = \sqrt{\lambda}v$

$$\frac{\Gamma}{\mathcal{V}} \simeq \left( \left( \frac{S}{2\pi} \right) \frac{12}{e^{D-1}} \lambda v^2 \right)^{D/2} \exp \left[ -S - \frac{1}{\Delta^{D-1}} \begin{cases} \frac{20+9 \ln 3}{54}, & D=3, \\ \frac{27-2\pi\sqrt{3}}{96}, & D=4, \end{cases} \right]$$

zero removal

determinant part

Renormalized action

$$S = \frac{1}{\Delta^{D-1}} \begin{cases} \frac{2^5 \pi v}{3^4 \sqrt{\lambda}} \left( 1 - \left( \frac{9\pi^2}{4} - 1 \right) \Delta^2 \right), & D=3 \\ \frac{\pi^2}{3\lambda} \left( 1 - \left( 2\pi^2 + \frac{9}{2} \right) \Delta^2 \right), & D=4 \end{cases}$$

New & relevant + much more...

Matteini, MN,  
Shoji, Ubaldi '23

General procedure for even and odd  $D$

**Bounces and prefactors**  
**are fascinating and relevant**

# Appendix

Zero removal

$$\Gamma \propto \frac{1}{\sqrt{\det \mathcal{O}'}} = \prod_n \sqrt{\frac{\lambda_{n\text{FV}}}{\lambda'_n}} \propto (v^2)^{D/2}$$

Eigenvalues have  $d=2$ , drop  $D$  of them, sqrt overall

However, we're working with  $\mathbf{G}\mathbf{Y}$ , so all the  $l=l$  eigenvalues are multiplied together

The trick: modified  $\mathbf{G}\mathbf{Y}$

$$(\mathcal{O}_{l=1} + \mu_\varepsilon^2) \psi_{l=1}^\varepsilon = 0$$

$$R_{l=1}^\varepsilon(\infty) = \frac{\psi_{l=1}^\varepsilon(\infty)}{\psi_{l=1}^{\text{FV}}(\infty)} \simeq \frac{(\mu_\varepsilon^2 + \gamma_1) \prod_{n=2}^\infty \gamma_n}{\prod_{n=1}^\infty \gamma_n^{\text{FV}}} = \mu_\varepsilon^2 R'_{l=1}(\infty)$$

We already have the needed fluctuation functions, easy to off-set

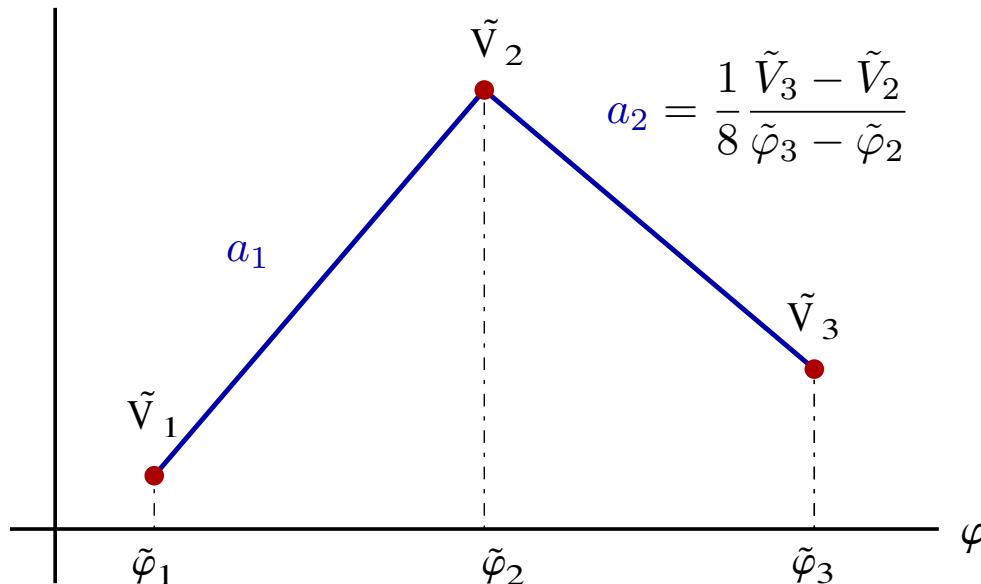

$$R'_{l=1}(\infty) = \lim_{\mu_\varepsilon^2 \rightarrow 0} \frac{1}{\mu_\varepsilon^2} R_{l=1}^\varepsilon(\infty) = \frac{e^{D-1}}{12} \frac{1}{\lambda v^2}$$

\* two other ways of seeing the same thing give the same answer

This answers the question of dimensional analysis estimate

# Triangular

$V(\varphi)$

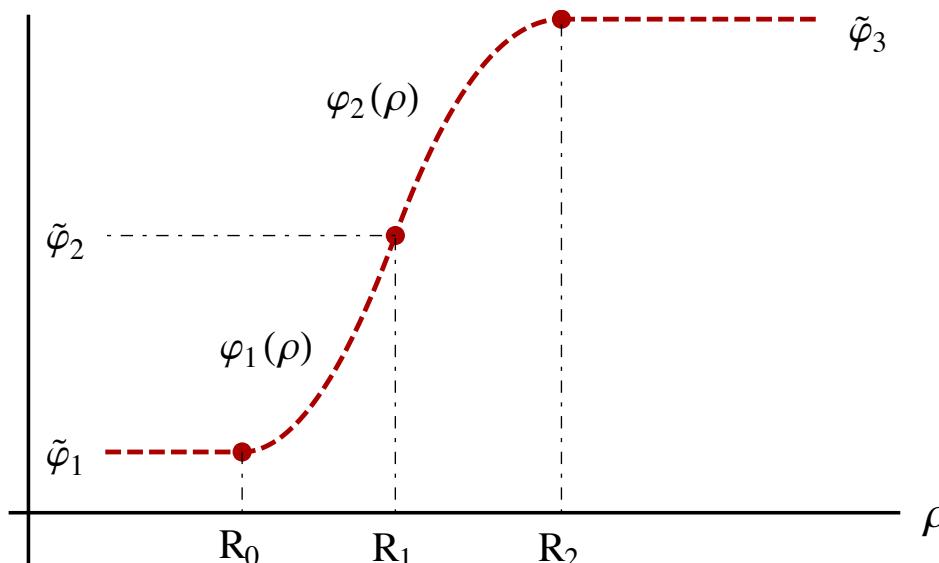

Duncan, Jensen '92

Exact solution

$$\ddot{\varphi} + \frac{3}{\rho} \dot{\varphi} = dV = 8 \textcolor{blue}{a}$$

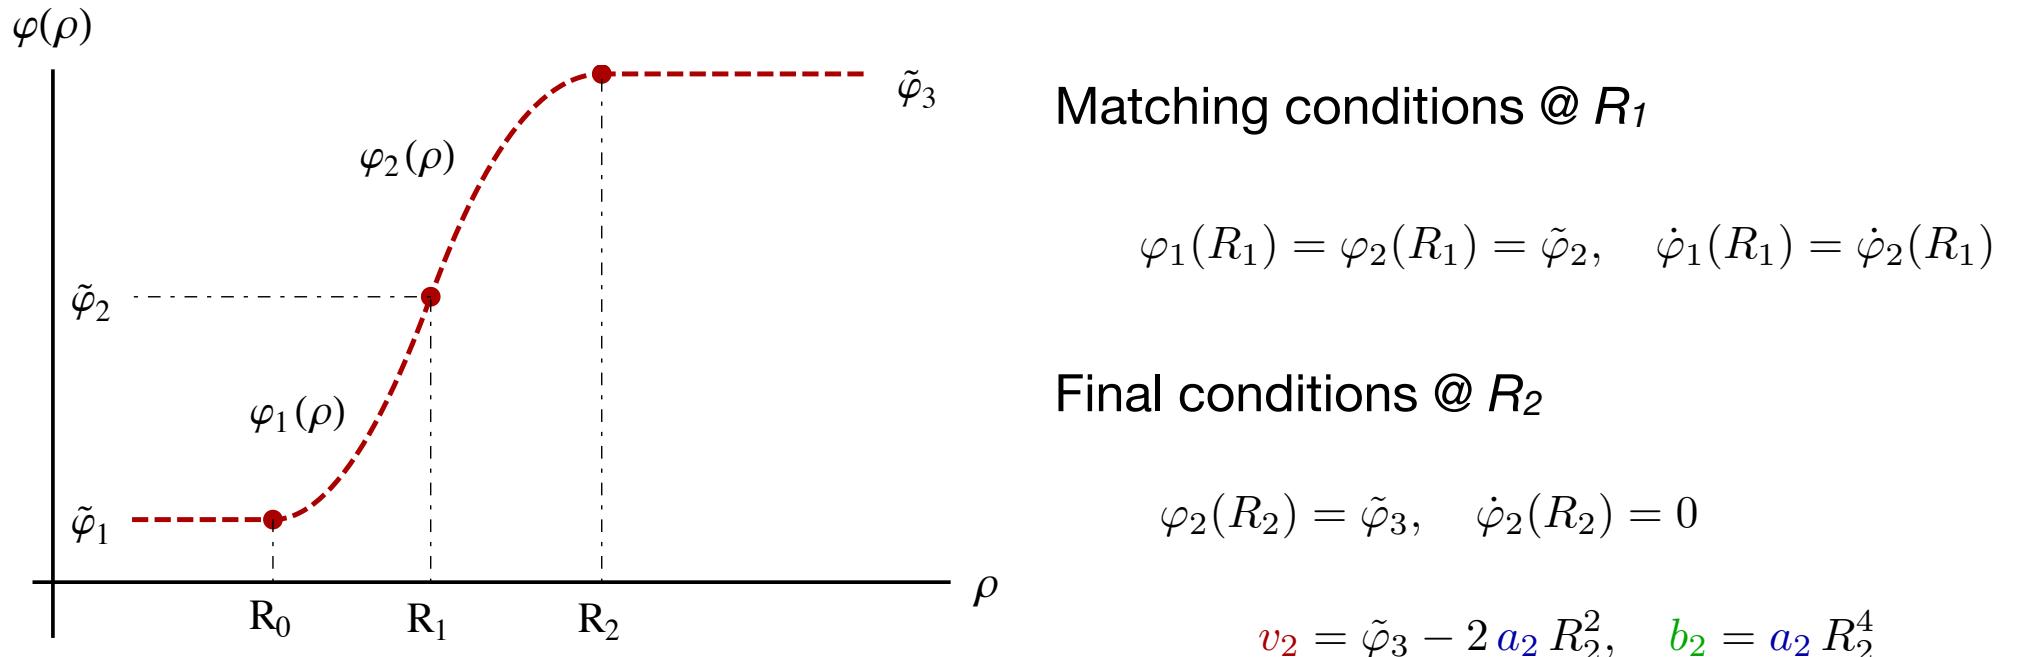

$$\varphi = \textcolor{red}{v} + \textcolor{blue}{a} \rho^2 + \frac{\textcolor{green}{b}}{\rho^2}$$

$\varphi(\rho)$

shoot in  $\varphi_0$

# Triangular

Complete solution - a) works in D-dimensions

- a)  $\varphi_0 = \frac{\tilde{\varphi}_3 + c \tilde{\varphi}_2}{1 + c}, \quad c = 2 \frac{a_2 - a_1}{a_1} \left( 1 - \sqrt{\frac{a_2}{a_2 - a_1}} \right) \quad R_1 = \sqrt{\frac{D}{4} \left( \frac{\tilde{\varphi}_2 - \varphi_0}{a_1} \right)}$

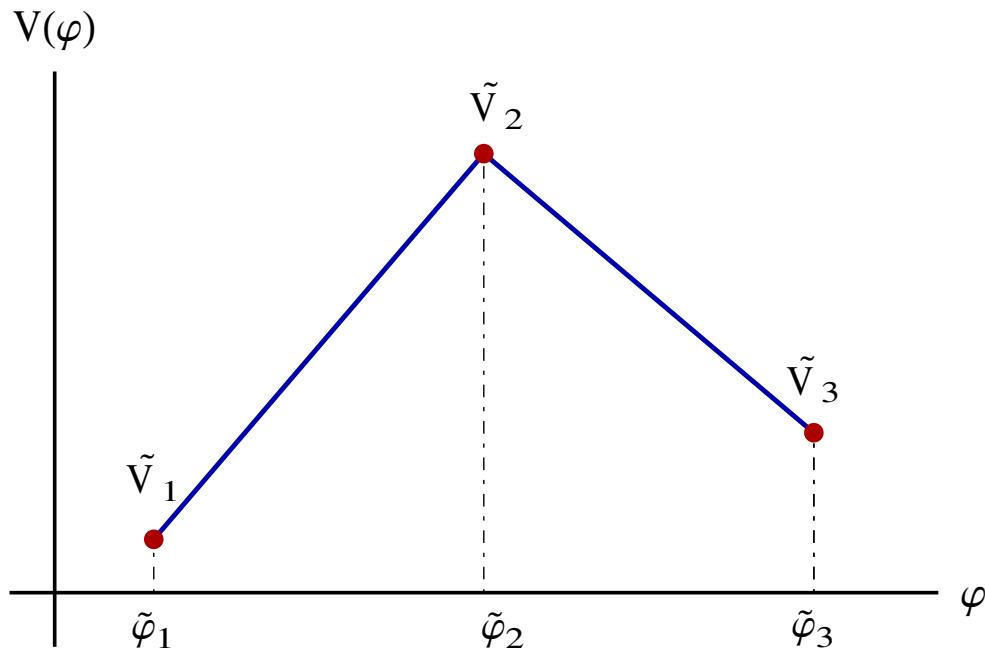

.....

- b)  $R_1 = \frac{1}{2} \frac{\tilde{\varphi}_3 - \tilde{\varphi}_1}{\sqrt{a_1 (\tilde{\varphi}_2 - \tilde{\varphi}_1)} - \sqrt{-a_2 (\tilde{\varphi}_3 - \tilde{\varphi}_2)}}$

$R_0^2 = R_1 \left( R_1 - \sqrt{\frac{\tilde{\varphi}_2 - \tilde{\varphi}_1}{a_1}} \right)$

$R_2^2 = R_1 \left( R_1 + \sqrt{\frac{\tilde{\varphi}_3 - \tilde{\varphi}_2}{-a_2}} \right)$

# Summary

Analytic continuation in Minkowski space  
describes the bubble evolution    **Pastras '11**

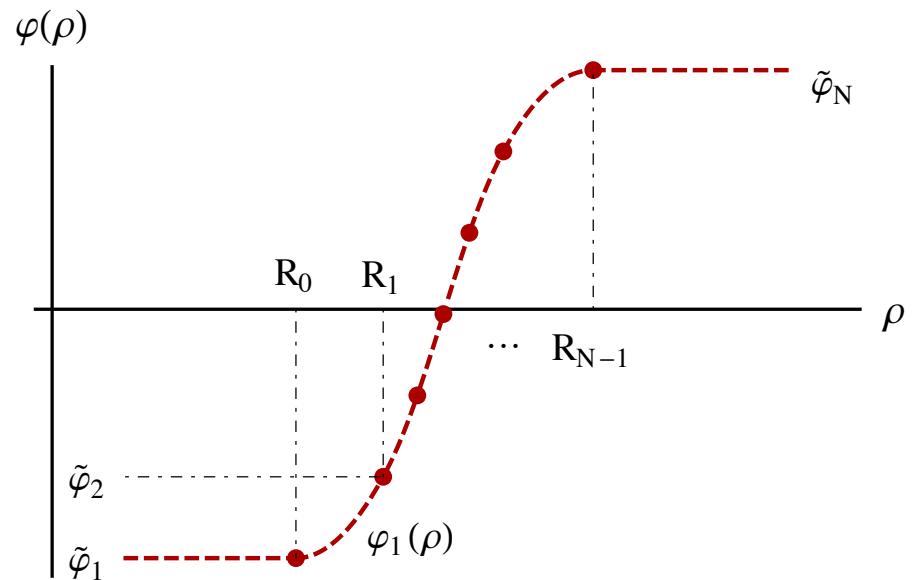

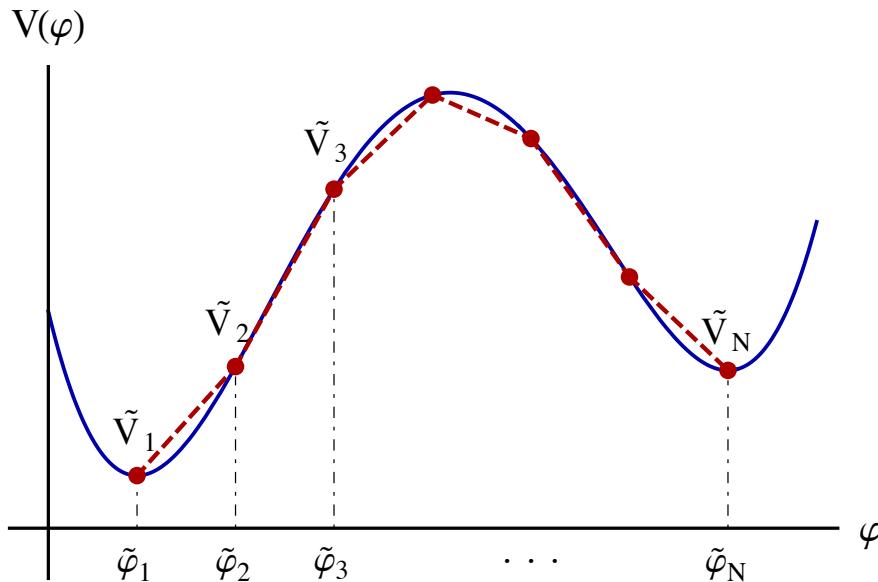

Complete exact analytic solution

Solved in terms of Euclidean radius

Stable in thin wall, goes over to TWA  
with limited validity

**Dutta, Hector, Konstandin,  
Vaudrevange, Westphal '12**

# Polygonal bounces

$$V_i(\varphi) = \underbrace{\left( \frac{\tilde{V}_{i+1} - \tilde{V}_i}{\tilde{\varphi}_{i+1} - \tilde{\varphi}_i} \right)}_{8 \text{ } \color{blue}{a}_i} (\varphi - \tilde{\varphi}_i) + \tilde{V}_i - \tilde{V}_N, \quad dV_i = 8 \text{ } \color{blue}{a}_i.$$

No free parameters, one segment three unknowns  $v_i$ ,  $b_i$ ,  $R_i$

Generalize case b), solve  $R_0$  or  $R_i$  a), retrieve  $\varphi_0$

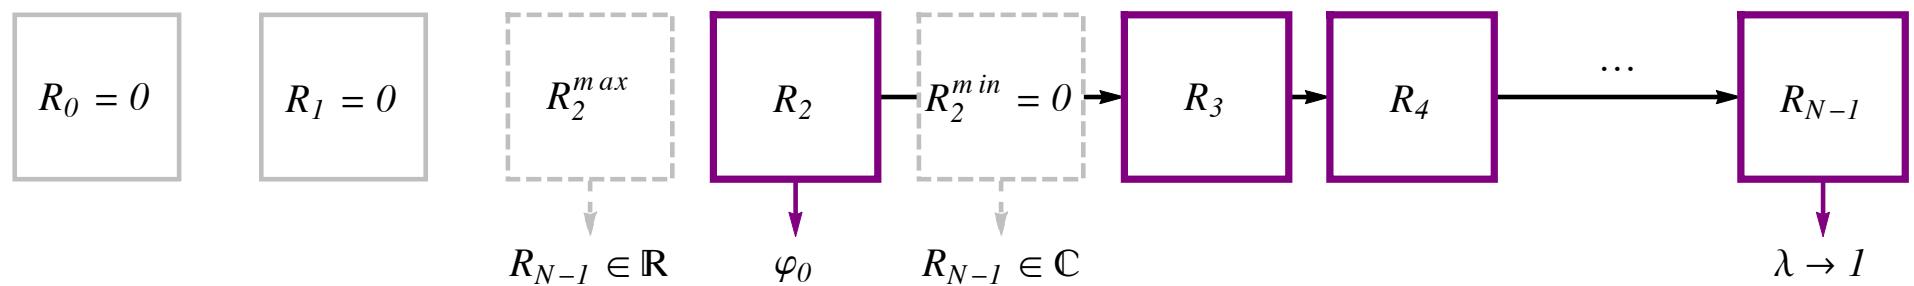

Radii computed at each segment from matching the fields

$$\varphi_n(R_n) = \tilde{\varphi}_{n+1}$$

**fewnomial**

$$R_n^D - \frac{D}{4} \frac{\delta_n}{a_n} R_n^{D-2} + \frac{D}{2(D-2)} \frac{b_n}{a_n} = 0 \quad \delta_n = \tilde{\varphi}_{n+1} - v_n$$

require real positive roots

# Bounce action

Euclidean action

$$S_D = \frac{2\pi^{\frac{D}{2}}}{\Gamma(\frac{D}{2})} \int_0^\infty \rho^{D-1} d\rho \left( \frac{1}{2} \dot{\varphi}^2 + V(\varphi) \right)$$

PB action

$$S_{>2} = \frac{2\pi^{\frac{D}{2}}}{\Gamma(\frac{D}{2})} \left\{ \frac{R_0^D}{D} \left( \tilde{V}_1 - \tilde{V}_N \right) + \sum_{i=1}^{N-1} \left[ \rho^2 \left( \frac{32a_i^2(D+1)\rho^D}{D^2(D+2)} + \frac{16a_i b_i}{D(D-2)} \right. \right. \right.$$
$$\left. \left. \left. - \frac{2b_i^2}{\rho^D(D-2)} \right) + \frac{\rho^D}{D} \left( 8a_i (v_i - \tilde{\varphi}_i) + \tilde{V}_i - \tilde{V}_N \right) \right]_{R_{i-1}}^{R_i} \right\}$$

Total

$$S = \mathcal{T} + \mathcal{V}$$

$$\mathcal{T} \propto \int_0^\infty \rho^{D-1} d\rho \dot{\varphi}^2,$$

kinetic

$$\mathcal{V} \propto \int_0^\infty \rho^{D-1} d\rho V(\varphi)$$

potential

# Derrick's theorem

Non-existence of non-trivial static solutions of  
KG equation, no solitonic scalar ‘particles’

Derrick '64

Unstable under re-scaling

$$\varphi(\rho) \rightarrow \varphi(\rho/\lambda)$$

$$\begin{aligned}\lambda \times 0 &= 0, \\ \lambda \times \infty &= \infty\end{aligned}$$

action is extremized at  
non-scaled values for  
true solutions

$$\frac{dS_D^{(\lambda)}}{d\lambda} \Big|_{\lambda=1} = 0$$

change of  
variables...remain  
the same

$$(D - 2)\mathcal{T} + D\mathcal{V} = 0$$

relation between  
kinetic and potential

$$\frac{d^2 S_D^{(\lambda)}}{d\lambda^2} \Big|_{\lambda=1} < 0$$

Caveat for PB

$$R \rightarrow \lambda R$$

Works for  $N \gg 1$

# Benchmarks

Back to thin wall

Coleman '77

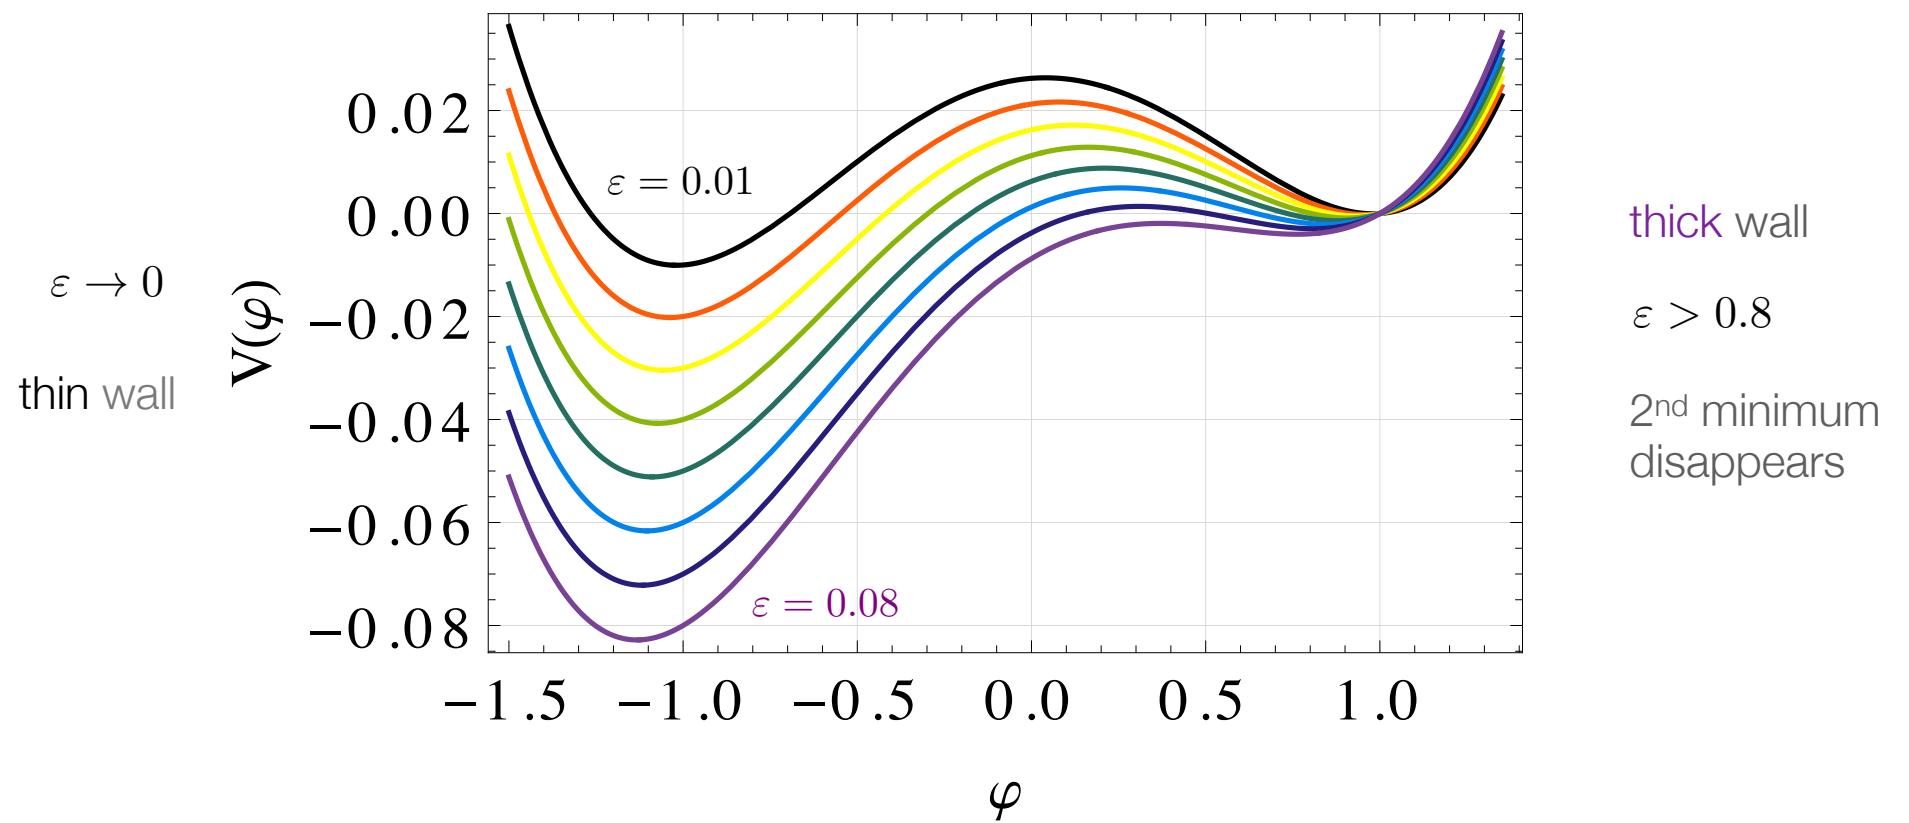

$$V(\varphi) = \frac{\lambda}{8} (\varphi^2 - v^2)^2 + \varepsilon \left( \frac{\varphi - v}{2v} \right)$$

Benchmark for testing

$\lambda = 0.25, v = 1$

rescaling

Sarid '98

# Euclidean action, comparisons

Mathematica, precise setting of initial values, issues with 0, infinity

PB within permille  
after 100 iterations

stable for thin/thick

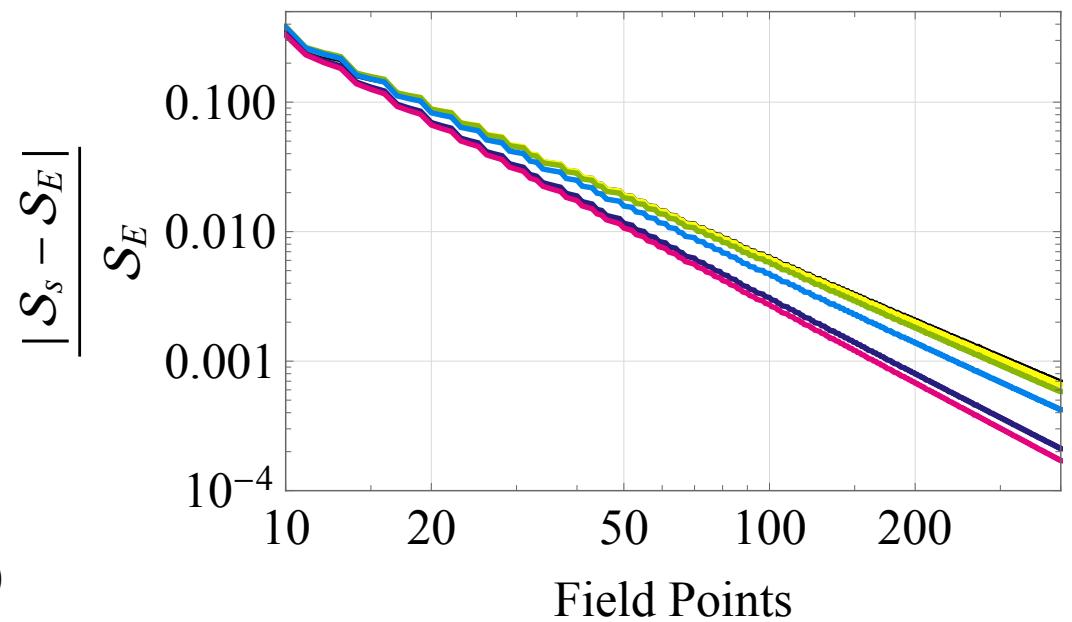

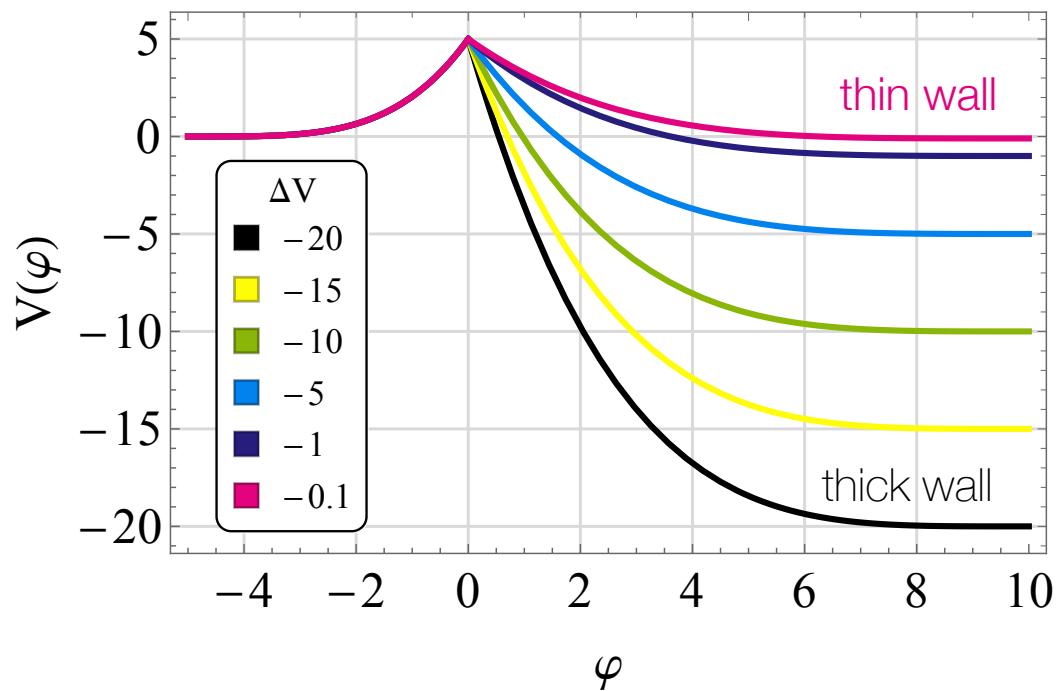

faster convergence  
for thin wall

# Bi-quartic

Other exact  $N=3$  potentials, quartic-linear, quartic-quartic

Dutta, Hector, Vaudrevange, Westphal '11

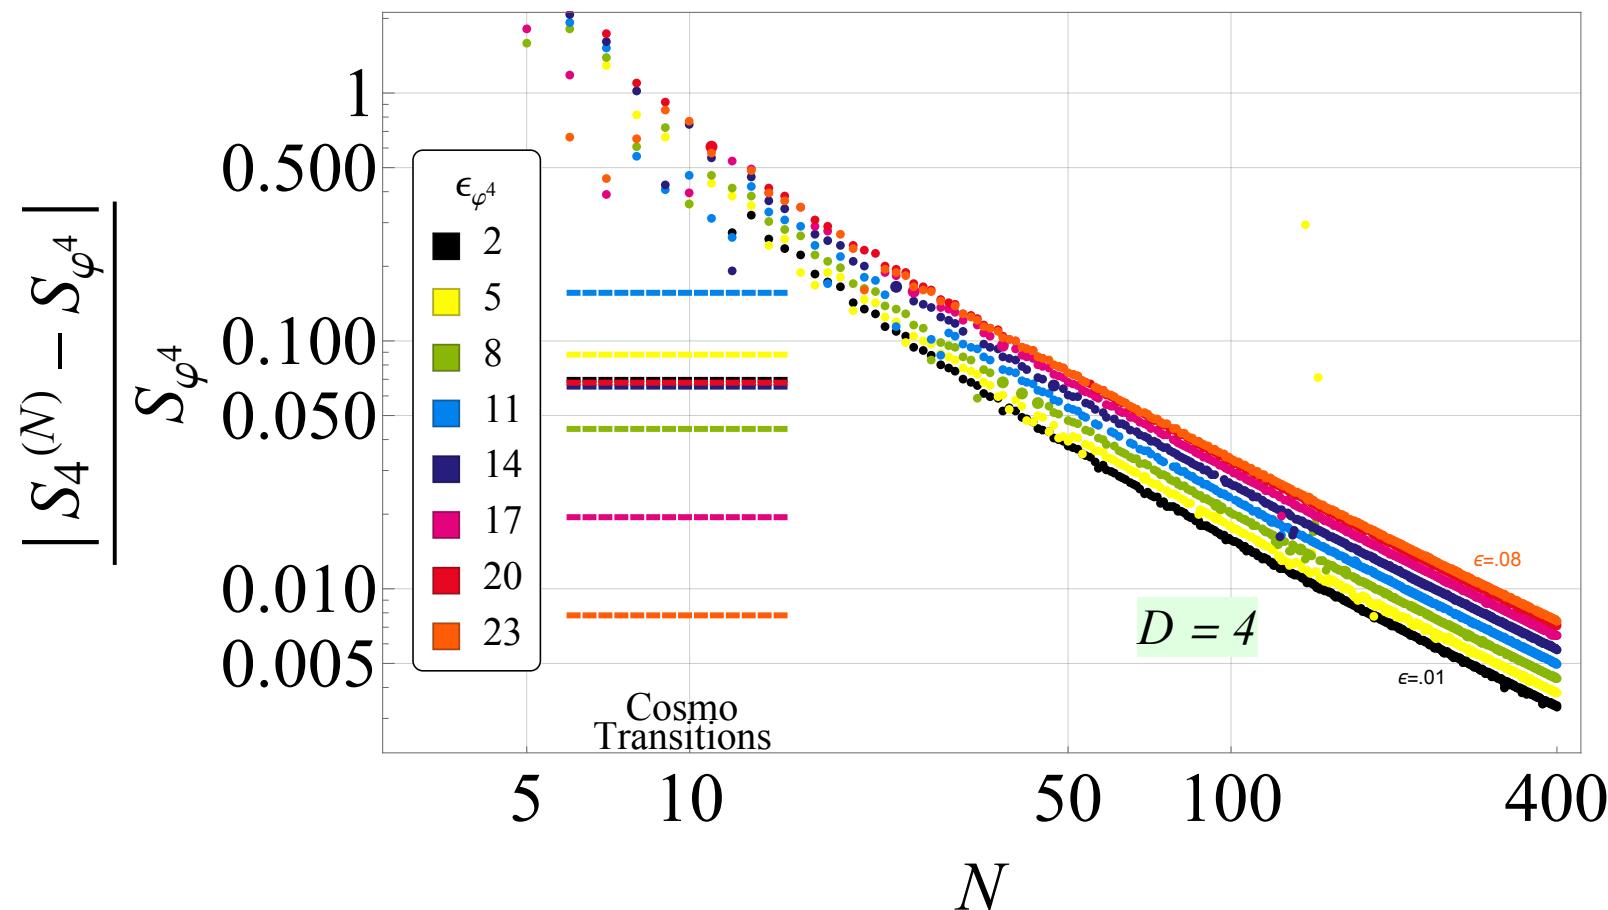

known exact solution, ‘fair’ comparison and test for the PB method

- CosmoTransitions fails with the action, possible to repair by hand, precise from 20% to 0.5%

- AnyBubble fails to compute

- Polygonal bounce works smoothly with a bi-homogeneous segmentation

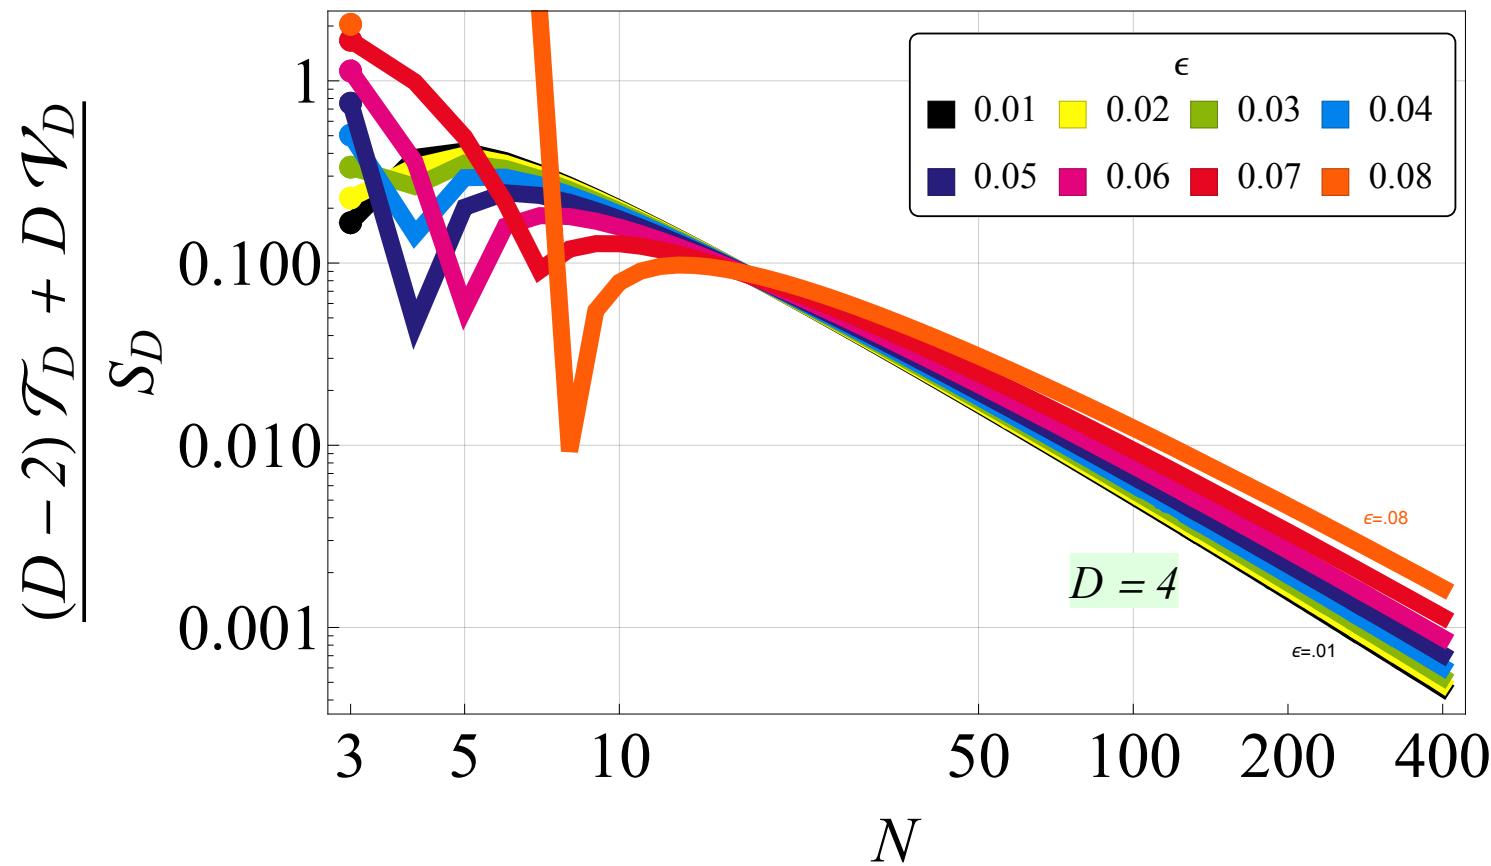

# Derrick's theorem

$$(D-2)\mathcal{T} + D\mathcal{V} \rightarrow 0$$

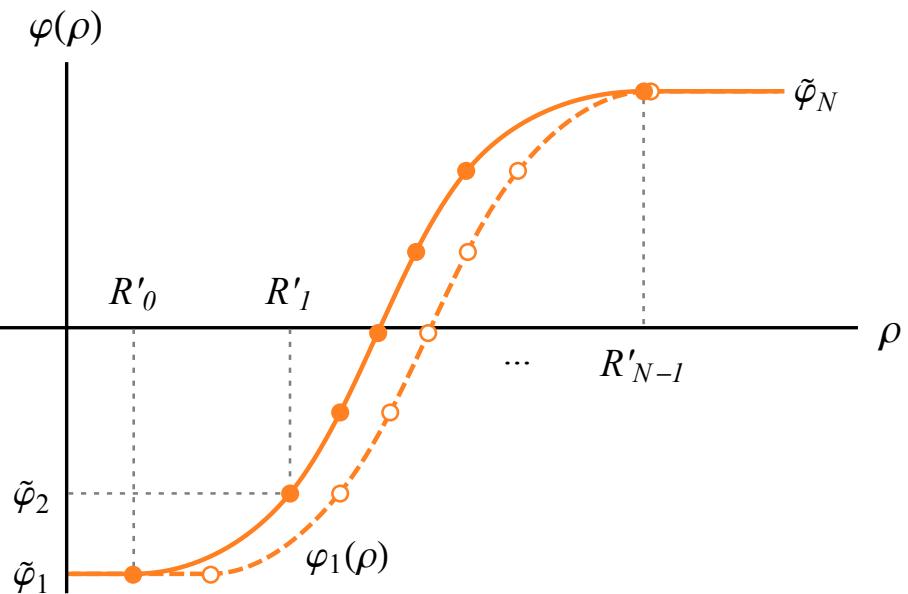

finite part corrections up to  $N \simeq 10$

independent measure of goodness of approximation

above relation ‘exact’ for the PB potential

# Higher orders

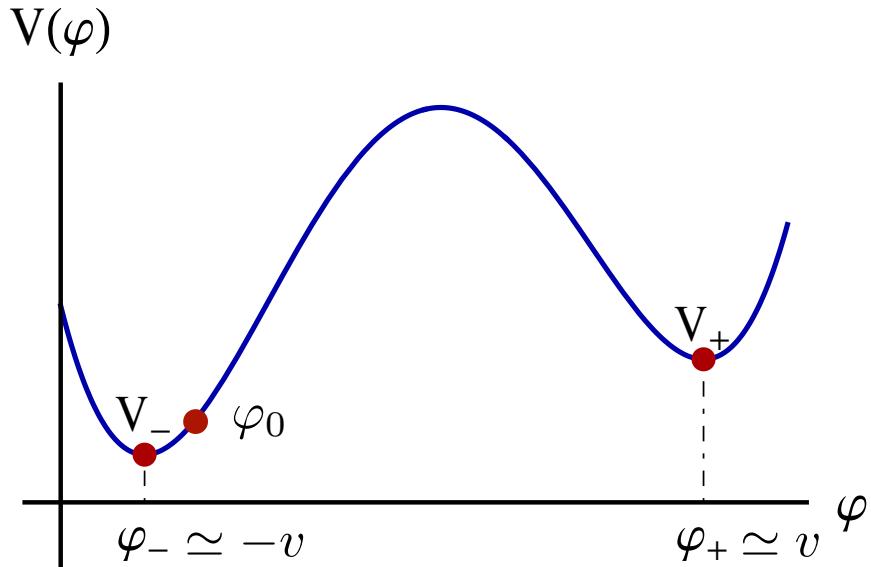

Match at perturbed radii

$$R_s \rightarrow R_s (1 + r_s), \quad r_s \ll 1$$

Rederive the matching conditions

A single linear equation = very fast

$$r_s = \frac{\beta_s + \frac{D-2}{2} \left( \nu_s + \mathcal{I}_s + \frac{4}{D} \alpha_s R_s^2 \right) R_s^{D-2}}{(D-2) \left( b_s - \frac{4}{D} a_s R_s^D \right)}$$

Thin wall approximation

Coleman '77

$$V(\varphi) = \frac{\lambda}{8} (\varphi^2 - v^2)^2 + \varepsilon \left( \frac{\varphi - v}{2v} \right), \quad S_1 = \frac{v^3 \sqrt{\lambda}}{3}$$

small  $\varepsilon$  limit       $\varphi_0 \simeq \varphi_-$       until       $\rho = R$

field solution

$$\varphi(\rho) = \begin{cases} -v, & \rho \ll R \\ \varphi_1(\rho - R), & \rho \approx R \\ v, & \rho \gg R \end{cases} \quad \varphi_1(\rho) = v \tanh \left( \frac{\sqrt{\lambda}v}{2} \rho \right)$$

extremize the action

bounce action

$$S_E = 2\pi^2 \int_0^\infty \rho^3 d\rho \left( \frac{1}{2} \dot{\varphi}^2 + V \right)$$

$$= -\frac{1}{2} \pi^2 R^4 \varepsilon + \pi^2 R^3 S_1$$

volume

surface

$$\frac{dS_E}{dR} = 0 \quad \Rightarrow \quad R = \frac{3S_1}{\varepsilon}$$

$$S_E = \frac{27\pi^2}{2} \frac{S_1^4}{\varepsilon^3}$$

runaway

$$\frac{d^2 S_E}{dR^2} < 0$$

Coleman '77  
Bödeker, Moore '09, '17

## Custom options control the input

“Dimension”	sets the Euclidean spacetime dimension, 3 or 4
“FieldPoints”	number of field points defines the segmentation
“Gradient”	one can pre-calculate the gradient, or make it numerical
“Hessian”	similar to the gradient, needed for multi-fields
“MaxPath”	limits the number of path iterations, typically small
“MidFieldPoint”	one can define a starting fixed point (e.g. the saddle)
“PathTolerance” & “ActionTolerance”	set a goal for the precision of the path variation and the Euclidean action

## Output is a bundled container that can be easily accessed

“Action”

sets the Euclidean spacetime dimension, 3 or 4

“Bounce”

number of field points defines the segmentation

“Coefficients”

one can pre-calculate the gradient, or make it numerical

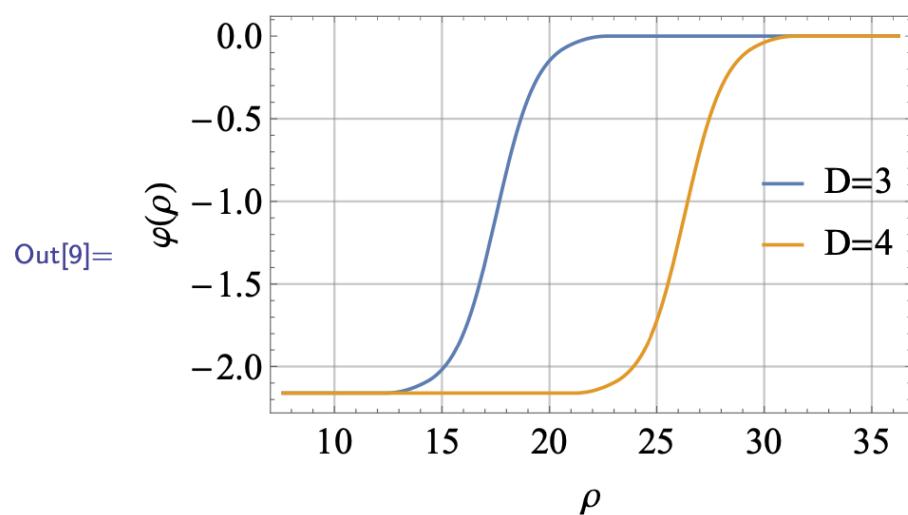

“Path”

similar to the gradient, needed for multi-fields

“Radii”

limits the number of path iterations, typically small

```

custom function for convenient plotting

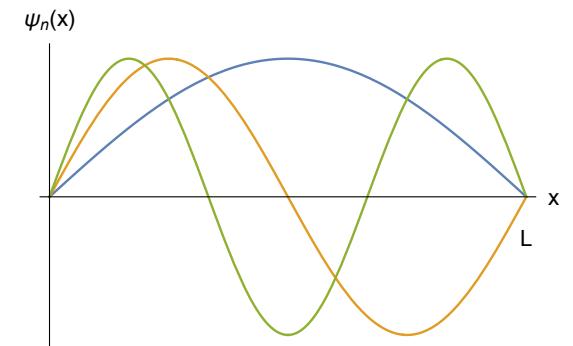

## Gel'fand-Yaglom aside

simplest instance of GY formalism ‘magic’

$$\mathcal{O} = -\frac{d^2}{dx^2} + m^2$$

$$\mathcal{O}_{\text{FV}} = -\frac{d^2}{dx^2}$$

QM well, classical 1D string

a) impose Dirichlet (fixed) boundary condition at L

$$\lambda_n = \left(\frac{n\pi}{L}\right)^2 + m^2, \quad \lambda_{n\text{FV}} = \left(\frac{n\pi}{L}\right)^2, \quad \frac{\det \mathcal{O}}{\det \mathcal{O}_{\text{FV}}} = \prod_{n=1}^{\infty} \frac{\lambda_n}{\lambda_{n\text{FV}}} = \frac{\sinh(mL)}{mL}$$

b) solve the Cauchy (open) boundary condition

$$\psi'' - m^2\psi = 0, \quad \psi(0) = 0, \quad \psi'(0) = 1, \quad \psi = \frac{\sinh(mx)}{m}, \quad \psi_{\text{FV}} = x$$

$$\frac{\det \mathcal{O}}{\det \mathcal{O}_{\text{FV}}} = \frac{\psi}{\psi_{\text{FV}}}(L) = \frac{\sinh(mL)}{mL}$$

Classical physical significance?
