#### Relevant characteristics of GUTs

- Gauge coupling unification
- SM quarks and leptons in the same gauge multiplets

Mineral detection of grand unification?

#### **GUTs** generically predict proton decay

Patrick Stengel (Jožef Stefan Institute)

 $MD\nu DM'25$ 

Mineral detection of grand unification?

#### Paleo-detector signatures are needles in a haystack

#### Large exposure from small target $\Rightarrow \, \mathrm{kg} \, \mathrm{Gyr} = 1 \, \mathrm{Mton} \, \mathrm{yr}$

Mineral detection of grand unification?

Proton decay signatures

#### Proton decay remnants could be detected by color centers

#### $^{6}\mathrm{Li}+n \rightarrow \alpha(2.1\mathrm{MeV}) + \mathrm{T}(2.7\mathrm{MeV})$

- Ranges of  $lpha \sim$  6 $\mu$ m,  $T \sim$  33 $\mu$ m
- Sparse CCs along track  $\sim 4 \mu m^{-1}$
- Bragg peaks brighter at the ends

#### PALEOCCENE arXiv:2503.20732

- 3D imaging of CCs in bulk
- Low ionizing CC tracks
- $\bullet~\mbox{Could scan}\sim\mbox{cm}^3$  in hours

Mineral detection of grand unification?

#### Fluorescent nuclear track detectors for $K^+$ endpoints

Figures from Kusumoto et al. (2022) show proton tracks in doped sapphire

- Theory of track formation?
- Are tracks robust to annealing?
- Use *dE/dx* proxy for tracks

Backgrounds Radiogenic

Nuclear recoils from  $\alpha$ -decays and spontaneous fission

Patrick Stengel (Jožef Stefan Institute)

Backgrounds

Cosmogenic

# Atmospheric neutrinos induce $\mathcal{O}(100) \, K^+/100 \, \mathrm{g/Gyr}$

Patrick Stengel (Jožef Stefan Institute)

#### Cosmogenic

### Lunar neutrinos induce $\sim 0.5 \, K^+ / 100 \, { m g/Gyr}$ in Olivine

Backgrounds Cosmogenic

#### Lunar muons induce $\sim 0.1 \, K^+ / 100 \, { m g/Gyr}$ at $\sim 5 \, { m km}$ depth

Sensitivity

# Expect $\lesssim 6~K^+/100~{ m g/Gyr}$ for $au(p ightarrowar{ u}K^+)>5.9 imes10^{33}$ yr

#### Sensitivity

#### Increase dE/dx threshold from 100 to 500 MeV/cm

Summary and outlook

#### Large exposures in MDs could probe DM and proton decay

# Cleaving and etching limits $\epsilon$ and can only reconstruct 2D

#### Readout scenarios for different $x_T$

- HIBM+pulsed laser could read out 10 mg with nm resolution
- SAXs at a synchrotron could resolve 15 nm in 3D for 100 g

Figure: HIM rodent kidney Hill+ '12, SAXs nanoporous glass Holler+ '14

#### Integrate stopping power to estimate track length

### Recognition of sparse tracks is a data analysis challenge

- 15 nm resolution of 100 g sample  $\Rightarrow 10^{19}$  mostly empty voxels
- 1 Gyr old with  $C^{238} = 0.01 \text{ ppb}$  $\Rightarrow 10^{13}$  voxels for  $\alpha$ -recoil tracks

#### Scattering cross sections $\Rightarrow$ scattering rates

$$\frac{d^2\sigma}{dq^2d\Omega_q} = \frac{d\sigma}{dq^2} \frac{1}{2\pi} \delta\left(\cos\theta - \frac{q}{2\mu_{XT}v}\right) \simeq \frac{\sigma_0 F(q)^2}{8\pi\mu_{XT}^2 v} \delta\left(v\cos\theta - \frac{q}{2\mu_{XT}}\right)$$
$$\frac{d^2R}{dE_R d\Omega_q} = 2M_T \frac{N_T}{M_T N_T} \int \frac{d^2\sigma}{dq^2 d\Omega_q} n_X v f(\mathbf{v}) d^3v \simeq \frac{\sigma_0 F(q)^2}{4\pi\mu_{XT}} n_X \hat{f}(\mathbf{v}_q, \hat{\mathbf{q}})$$

#### Differential cross section

- $\delta$ -function imposes kinematics
- $\sigma_0$  is velocity and momentum independent cross section for scattering off pointlike nucleus  $F(q) \simeq \frac{9 [\sin(qR) - qR \cos(qR)]^2}{(qR)^6}$

#### Differential scattering rate

- Rate per unit time per unit detector mass for all nuclei
- Convolute cross section with astrophysical WIMP flux

$$\sigma_0^{SI} = \frac{4}{\pi} \mu_{XT}^2 \left[ Z f_s^p + (A - Z) f_s^n \right]^2$$

#### Nuclear recoils induced by elastic WIMP-nucleus scattering

#### WIMP velocity distribution and induced recoil spectra

Patrick Stengel (Jožef Stefan Institute)

 $MD\nu DM'25$ 

#### Mineral detectors used to constrain WIMPs before

#### Use track length spectra to pick out WIMP signal

#### Track length spectra after smearing by readout resolution

#### Trade-off between read-out resolution and exposure

#### Sensitivity for different targets

Halite Gypsum Sinjarite Olivine Phlogopite Nchwaningite  $\begin{array}{c} {\sf NaCl} \\ {\sf Ca}({\sf SO}_4) \cdot 2({\sf H}_2{\sf O}) \\ {\sf CaCl}_2 \cdot 2({\sf H}_2{\sf O}) \\ {\sf Mg}_{1.6}{\sf Fe}_{0.4}^{2+}({\sf SiO}_4) \\ {\sf KMg}_3{\sf AlSi}_3{\sf O}_{10}{\sf F}({\sf OH}) \\ {\sf Mn}_2^{2+}{\sf SiO}_3({\sf OH})_2 \cdot ({\sf H}_2{\sf O}) \end{array}$ 

$$\begin{array}{l} C^{238} = 10^{-11} \ {\rm g/g} \\ C^{238} = 10^{-11} \ {\rm g/g} \\ C^{238} = 10^{-11} \ {\rm g/g} \\ C^{238} = 10^{-10} \ {\rm g/g} \end{array}$$

#### Effects of background shape systematics

# Sensitivity for different <sup>238</sup>U concentrations

#### Multiple nuclei and large $\epsilon$ allow for optimal $\Delta m_X/m_X$

# Mineral detectors can look for signals "averaged" over geological timescales or for time-varying signals

#### Multiple samples to detect dark disk transit every $\sim$ 45 Myr

 $m_X^{\text{disk}} = 100 \text{ GeV} \ \sigma_{Xp}^{\text{disk}} = 10^{-43} \text{ cm}^2 \ m_X = 500 \text{ GeV} \ \sigma_{Xp} = 5 \times 10^{-46} \text{ cm}^2$ 

Patrick Stengel (Jožef Stefan Institute)

 $MD\nu DM'25$ 

May 23, 2025

# Distinguish from halo with 20, 40, 60, 80, 100 Myr samples

Systematic uncertainties  $\Delta_t = 5\% \ \Delta_M = 0.1\% \ \Delta_C = 10\% \ \Delta_{\Phi} = 100\%$ 

Patrick Stengel (Jožef Stefan Institute)

 $MD\nu DM'25$ 

#### Change number of samples and sample spacing in time

#### Neutrinos come from a variety of sources

#### Nuclear recoil spectrum depends on neutrino energy

$$\frac{dR}{dE_R} = \frac{1}{m_T} \int dE_\nu \, \frac{d\sigma}{dE_R} \frac{d\phi}{dE_\nu}$$

Figure: COHERENT, 1803.09183

- Quasi-elastic for  $E_{
  u}\gtrsim 100\,{
  m MeV}$
- Resonant  $\pi$  production at  $E_{\nu} \sim \text{GeV}$
- Deep inelastic for  $E_{
  u}\gtrsim 10\,{
  m GeV}$

Figure: Inclusive CC  $\sigma_{\nu N}$ , 1305.7513

#### Atmospheric $\nu$ 's originating from CR interactions

#### Atmospheric $\nu$ 's originating from CR interactions

Figure:  $E_{CR}$  to leptons, 1806.04140

Figure: FLUKA simulation of  $\nu_{\mu}$  flux at SuperK for solar max, hep-ph/0207035

#### Geomagnetic field deflects lower energy CR primaries

Figure: Driscoll, P. E. (2016), Geophys. Res. Lett., 43, 5680-5687

#### Rigidity $p_{CR}/Z_{CR} \simeq E_{CR}$ for CR protons

- Rigidity cutoff  $\propto M_{dip}$  truncates atmospheric  $\nu$  spectrum at low  $E_{\nu}$
- Maximum cutoff today  $\sim 50\,{
  m GV}$
- Recall CR primary  $E_{CR}\gtrsim 10~E_{
  u}$

# Recoil spectra from atmospheric $\nu$ 's incident on NaCl(P)

Recoils of many different nuclei	Background free regions for $\gtrsim 1\mu{ m m}$			
<ul> <li>Low energy peak from QE</li></ul>	<ul> <li>Radiogenic n-bkg confined to</li></ul>			
neutrons scattering <sup>23</sup> Na, <sup>31</sup> P	low x, regardless of target			
<ul> <li>High energy tail of lighter</li></ul>	<ul> <li>Subdominant systematics from</li></ul>			
nuclei produced by DIS	atmosphere, heliomagnetic fiel			

Patrick Stengel (Jožef Stefan Institute)

#### Galactic contribution to $\nu$ flux over geological timescales

Figure: Supernova simulation after CC

#### Only $\sim 2$ SN 1987A events/century

- Measure galactic CC SN rate
- Traces star formation history

Figure: Cosmic CC SNR, 1403.0007

25 / 30

#### Galactic contribution to $\nu$ flux over geological timescales

Figure: Cosmic CC SNR, 1403.0007

# Sensitivity to galactic CC SN rate depends on $C^{238}$

Epsomite  $[Mg(SO_4) \cdot 7(H_2O)]$ Halite [NaCl] Nchwaningite  $[Mn_2^{2+}SiO_3(OH)_2 \cdot (H_2O)]$ Olivine  $[Mg_{1.6}Fe_{0.4}^{2+}(SiO_4)]$ 

#### Difficult to pick out time evolution of galactic CC SN rate

Coarse grained cumulative time bins	Determine $\sigma$ rejecting constant rate
• 10 Epsomite paleo-detectors • 100 g each, $\Delta t_{ m age} \simeq 100  { m Myr}$	Could only make discrimination at $3\sigma$ for $\mathcal{O}(1)$ increase in star formation rate with $C^{238} \lesssim 5\mathrm{ppt}$

#### Solar $\nu$ 's produced in fusion chains from H to He

Figure: Today's flux at Borexino (Nature, 2018) and time dependence of GS metallicity model, 2102.01755

### Could use large exposure to differentiate between scenarios

Could measure <sup>8</sup> B flux over	time 100 g sam	100 g samples with 15 nm resolution					
• Higher $E_ u \Rightarrow$ longer tra	acks • Look	in single bin $15-3$	30 nm				
• Highly dependent on so temperature with flux of	blar core • Assur $\times T^{24}$ • $N_{\text{tot}}^{\text{GS}}$	ne $\Delta_t \sim 10\%, \ \Delta_C \sim (1.63 \pm 0.05)  imes 1$	= 10% 10 <sup>6</sup>				
• Sensitive to metallicity	model $N_{\rm tot}^{\rm AGS}$	$^{ m S}\sim$ (1.52 $\pm$ 0.05) $^{ m S}$	imes 10 <sup>6</sup>				
Patrick Stengel (Jožef Stefan Institute)	MDvDM'25	May 23, 2025	30 / 30
