Searches for BSM at the LHC

Reinterpretation

Hypothesis testing

By the Neyman-Pearson lemma,
for testing simple hypotheses
the most powerful test statistic is
the likelihood ratio

$$q = -2 \ln \frac{L(\text{data} | H_0)}{L(\text{data} | H_1)}$$

Hypothesis testing

Our hypotheses are composite:

- ✿ We have nuisance parameters θ
- ✿ We have a parameter of interest μ

Hypothesis testing

Our hypotheses are composite:

✿ We have nuisance parameters θ

✿ We have a parameter of interest μ

$$\tilde{q}_\mu = \begin{cases} -2 \ln \frac{L(\mu, \hat{\hat{\theta}}(\mu))}{L(0, \hat{\hat{\theta}}(0))} & \hat{\mu} < 0, \\ -2 \ln \frac{L(\mu, \hat{\hat{\theta}}(\mu))}{L(\hat{\mu}, \hat{\theta})} & 0 \leq \hat{\mu} \leq \mu, \\ 0 & \hat{\mu} > \mu \end{cases}$$

$\hat{\square}$ unconditional MLE

$\hat{\hat{\square}}(\mu)$ conditional MLE

Full likelihood models by ATLAS (Hist Factory)

$$L(n, a | \mu, \theta) = \prod_c^{\text{channels}} \prod_b^{\text{bins}_c} \text{Pois} \left(n_{cb} | \nu_{cb}(\mu, \theta) \right) \prod_{\theta} p_{\theta} \left(a_{\theta} | \theta \right)$$

Full statistical model calculations enter here

Computational bottleneck

Machine learning enters here

Use Machine Learning to create surrogates
to Full Statistical Models that would be
accurate but much faster to use.

The approach

If we have a regressor for profiled likelihoods, we can calculate limits.

$$\Delta_{\text{data}}^{(\mu_1, \dots, \mu_N)} \equiv \ln \frac{L \left(\text{data} \mid \mu_1, \dots, \mu_N; \hat{\hat{\theta}}(\mu_1, \dots, \mu_N) \right)}{L \left(\text{data} \mid 0, \dots, 0; \hat{\hat{\theta}}(0, \dots, 0) \right)}$$

The approach

varying signal
in each bin independently

profiling

$$\Delta_{\text{data}}^{(\mu_1, \dots, \mu_N)} \equiv \ln \frac{L\left(\text{data} \mid \mu_1, \dots, \mu_N; \hat{\hat{\theta}}(\mu_1, \dots, \mu_N)\right)}{L\left(\text{data} \mid 0, \dots, 0; \hat{\hat{\theta}}(0, \dots, 0)\right)}$$

Four data sets are used:

- 1) expected data
- 2) expected Asimov data
- 3) observed data
- 4) observed Asimov data

The approach

yields

regression

likelihoods

limits

Fully connected network

$$\Delta(\mu_1, \dots, \mu_N)_{\text{exp}}$$

$$\Delta(\mu_1, \dots, \mu_N)_{\text{exp Asimov}}$$

$$\Delta(\mu_1, \dots, \mu_N)_{\text{obs}}$$

$$\Delta(\mu_1, \dots, \mu_N)_{\text{obs Asimov}}$$

Moszna Castle, Poland

Search for direct stau production in events with two hadronic τ -leptons in $\sqrt{s}=13$ TeV pp collisions with the ATLAS detector

2 signal bins, 3 control bins

fit **without** the CRs

ATLAS-SUSY-2018-04 (1911.0660)

expected

observed

Search for direct production of electroweakinos in final states with one lepton, missing transverse momentum and a Higgs boson decaying into two b-jets in pp collisions at $\sqrt{s}=13$ TeV with the ATLAS detector

9 signal bins, 5 control bins

ATLAS-SUSY-2019-08 (1909.09926)

expected

observed

Search for electroweak production of charginos and sleptons decaying into final states with two leptons and missing transverse momentum in $\sqrt{s}=13$ TeV pp collisions using the ATLAS detector

36 SRs and 3 CRs

ATLAS-SUSY-2018-32 (1908.08215)

expected

observed

- Searches for electroweak production of supersymmetric particles with compressed mass spectra in $\sqrt{s}=13$ TeV pp collisions with the ATLAS detector
- 2 subanalyses: sleptons (32+6) and EWKinos (38+6)
- Subanalyses combination: 70 SRs + 12 CRs (disjoint in this particular case)

ATLAS-SUSY-2018-16 (1911.12606)

expected (sleptons)

observed (sleptons)

ATLAS-SUSY-2018-16 (1911.12606)

expected (EWKinosh)

observed (EWKinosh)

Książ Castle, Poland

Search for chargino-neutralino pair production in final states with three leptons and missing transverse momentum in $\sqrt{s}=13$ TeV pp collisions with the ATLAS detector

4 subanalyses:

onshell (W/Z when decaying) **wino/bino** (22+2)

offshell wino/bino minus (sign of the product of two neutralino mass eigenstates) (32+2)

offshell wino/bino plus (32+2)

offshell higgsino (32+2)

Subanalyses combination: 54 SRs + 4 CRs (full overlap for offshell subanalyses)

Kolmogorov-Arnold networks

from Liu et al (2404.19756)

Model	Multi-Layer Perceptron (MLP)	Kolmogorov-Arnold Network (KAN)
Theorem	Universal Approximation Theorem	Kolmogorov-Arnold Representation Theorem
Formula (Shallow)	$f(\mathbf{x}) \approx \sum_{i=1}^{N(e)} a_i \sigma(\mathbf{w}_i \cdot \mathbf{x} + b_i)$	$f(\mathbf{x}) = \sum_{q=1}^{2n+1} \Phi_q \left(\sum_{p=1}^n \phi_{q,p}(x_p) \right)$
Model (Shallow)	(a)  fixed activation functions on nodes learnable weights on edges	(b)  learnable activation functions on edges sum operation on nodes
Formula (Deep)	$\text{MLP}(\mathbf{x}) = (\mathbf{W}_3 \circ \sigma_2 \circ \mathbf{W}_2 \circ \sigma_1 \circ \mathbf{W}_1)(\mathbf{x})$	$\text{KAN}(\mathbf{x}) = (\Phi_3 \circ \Phi_2 \circ \Phi_1)(\mathbf{x})$
Model (Deep)	(c)  MLP(x) $\mathbf{W}_3$ σ_2 $\mathbf{W}_2$ σ_1 $\mathbf{W}_1$ $\mathbf{x}$ nonlinear, fixed linear, learnable	(d)  KAN(x) Φ_3 Φ_2 Φ_1 $\mathbf{x}$ nonlinear, learnable

Kolmogorov-Arnold networks

🌸 KANs allow to find analytical formulas describing data

🌸 It might be possible, in some cases, to find analytical approximations to likelihood and speed up computations even further

ATLAS-SUSY-2018-04 (1911.0660)

Summary

- ✿ Selecting the right BSM model enhances chances of new physics discovery
- ✿ Reinterpretation allows to constrain untested models
- ✿ Proper hypotheses testing is possible with published Full Statistical Models
- ✿ However, using these models constitute a **computational bottleneck**
- ✿ Machine Learning surrogates offer **good accuracy with much** (orders of magnitude) **faster computations**
- ✿ Preliminary results with MLPs are promising
- ✿ The next step will be to try KANs
- ✿ Trained models will be published to be used by the community

Tatra mountains, Poland
